Introduction to **Big** Data

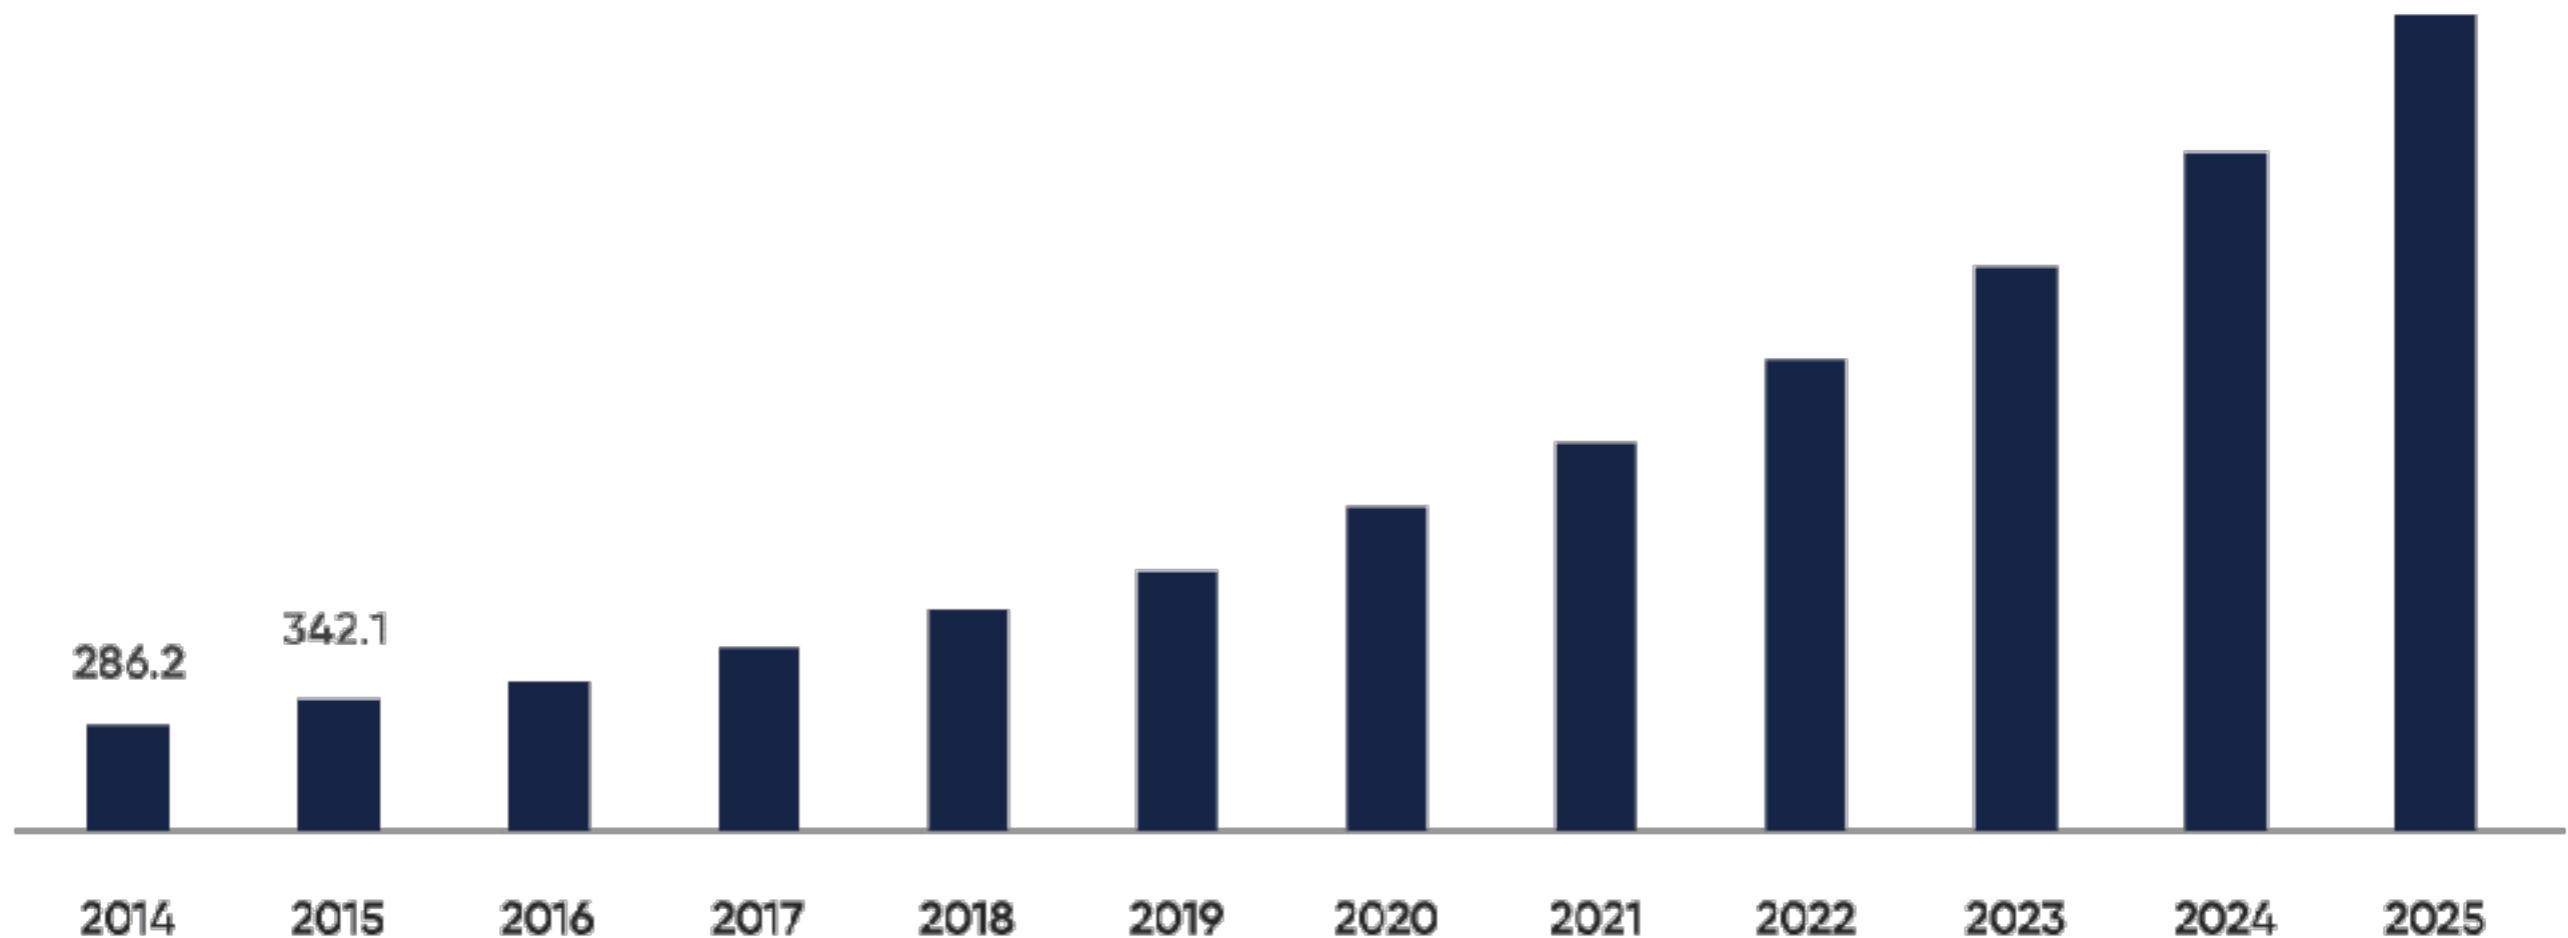

Timeline

Timeline

U.S. Data Analytics outsourcing market size, 2014 - 2025 (USD Million)

Big Data

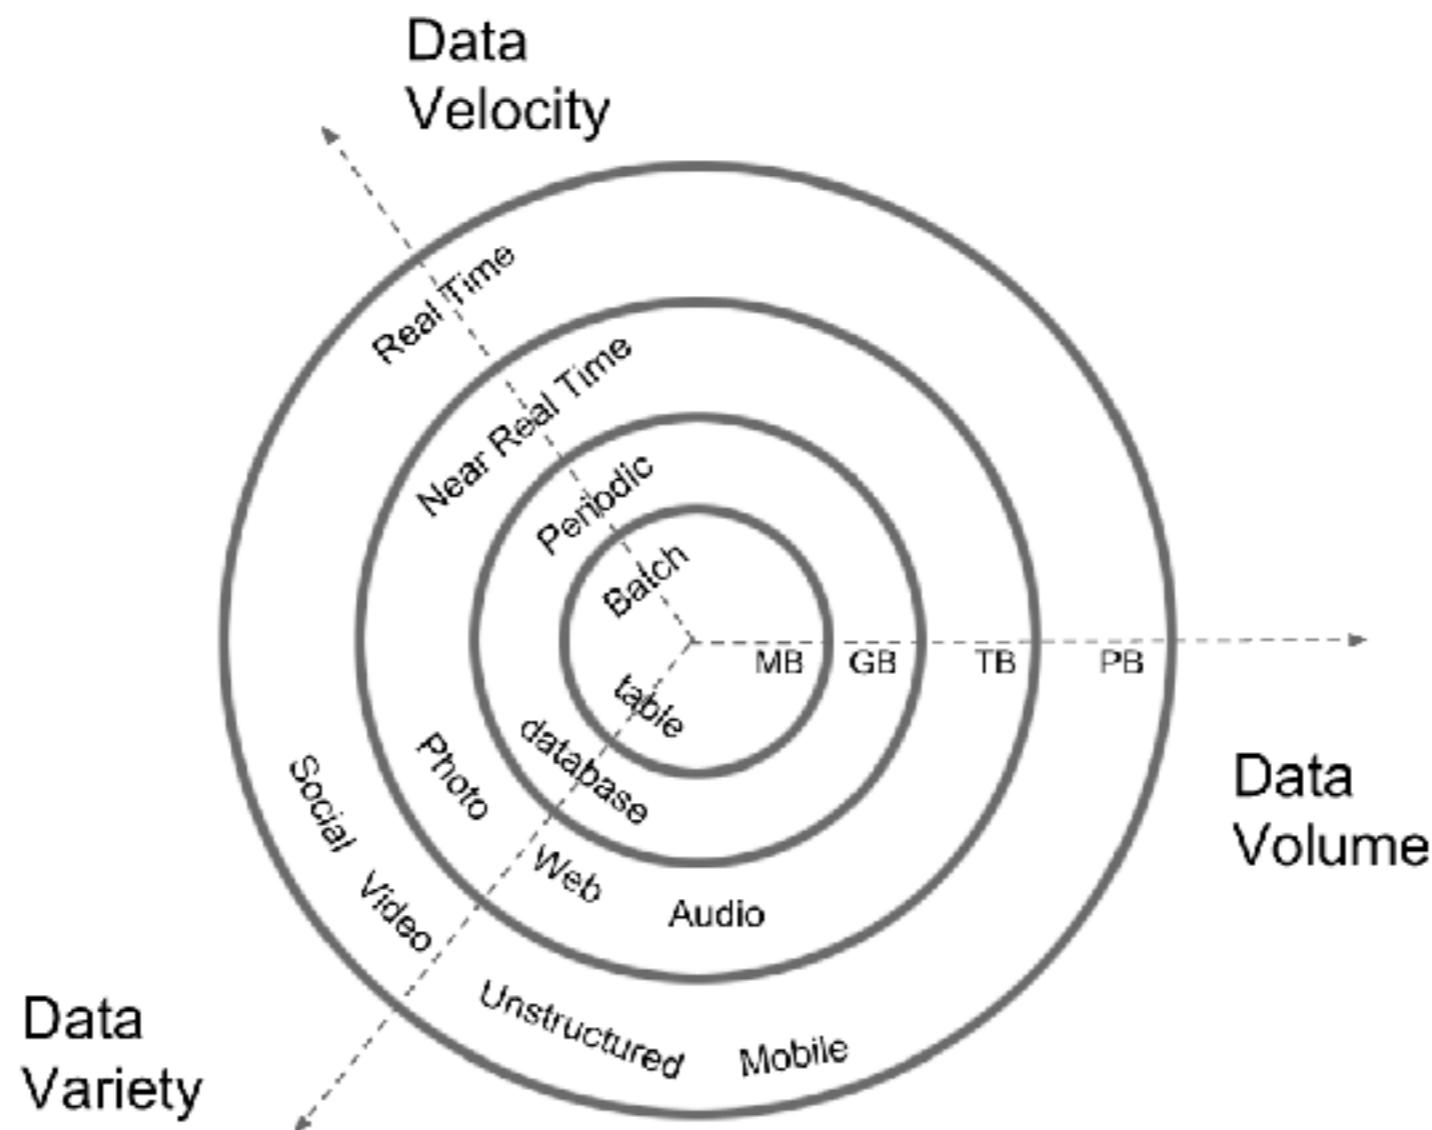

Refer to the vast amount of structured and unstructured data generated at high velocity, variety, and volume

Data is too complex to processed by traditional databases and tools

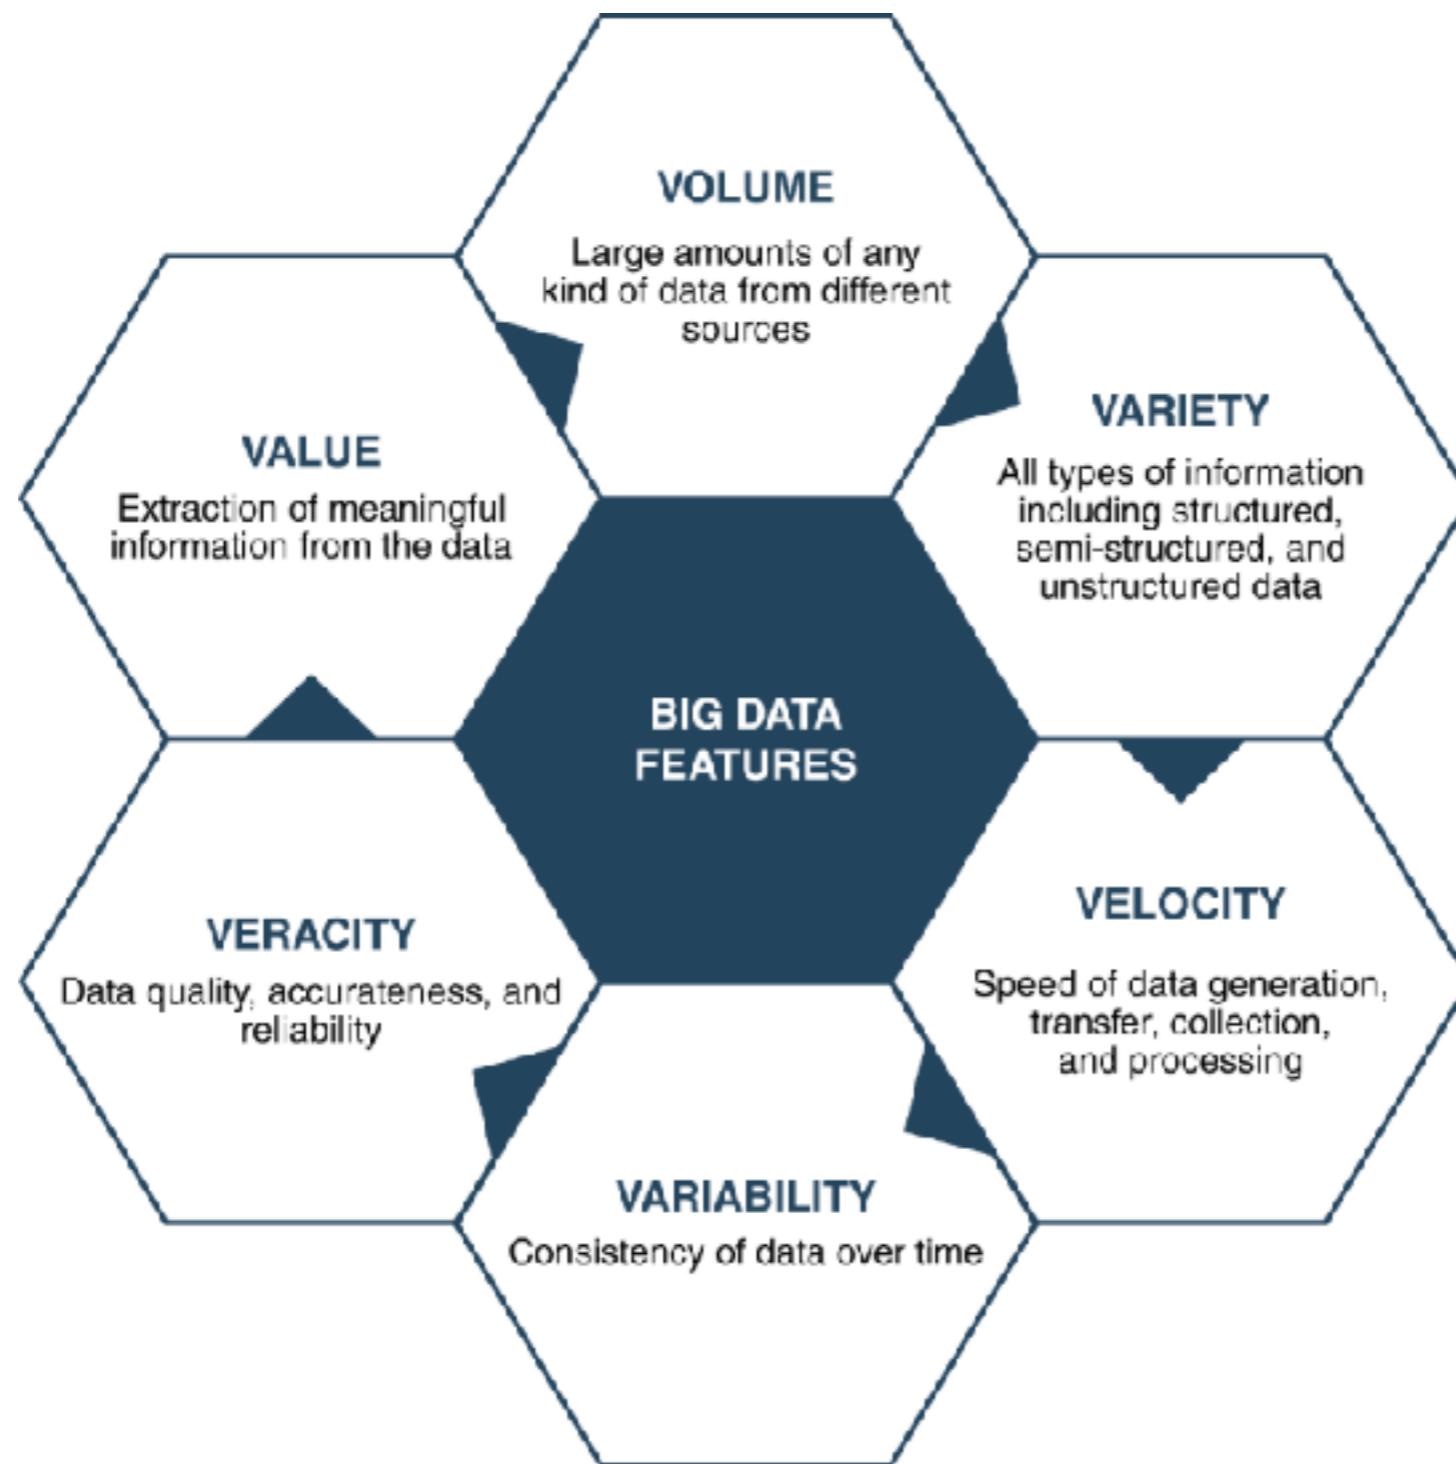

Characteristics for Big Data

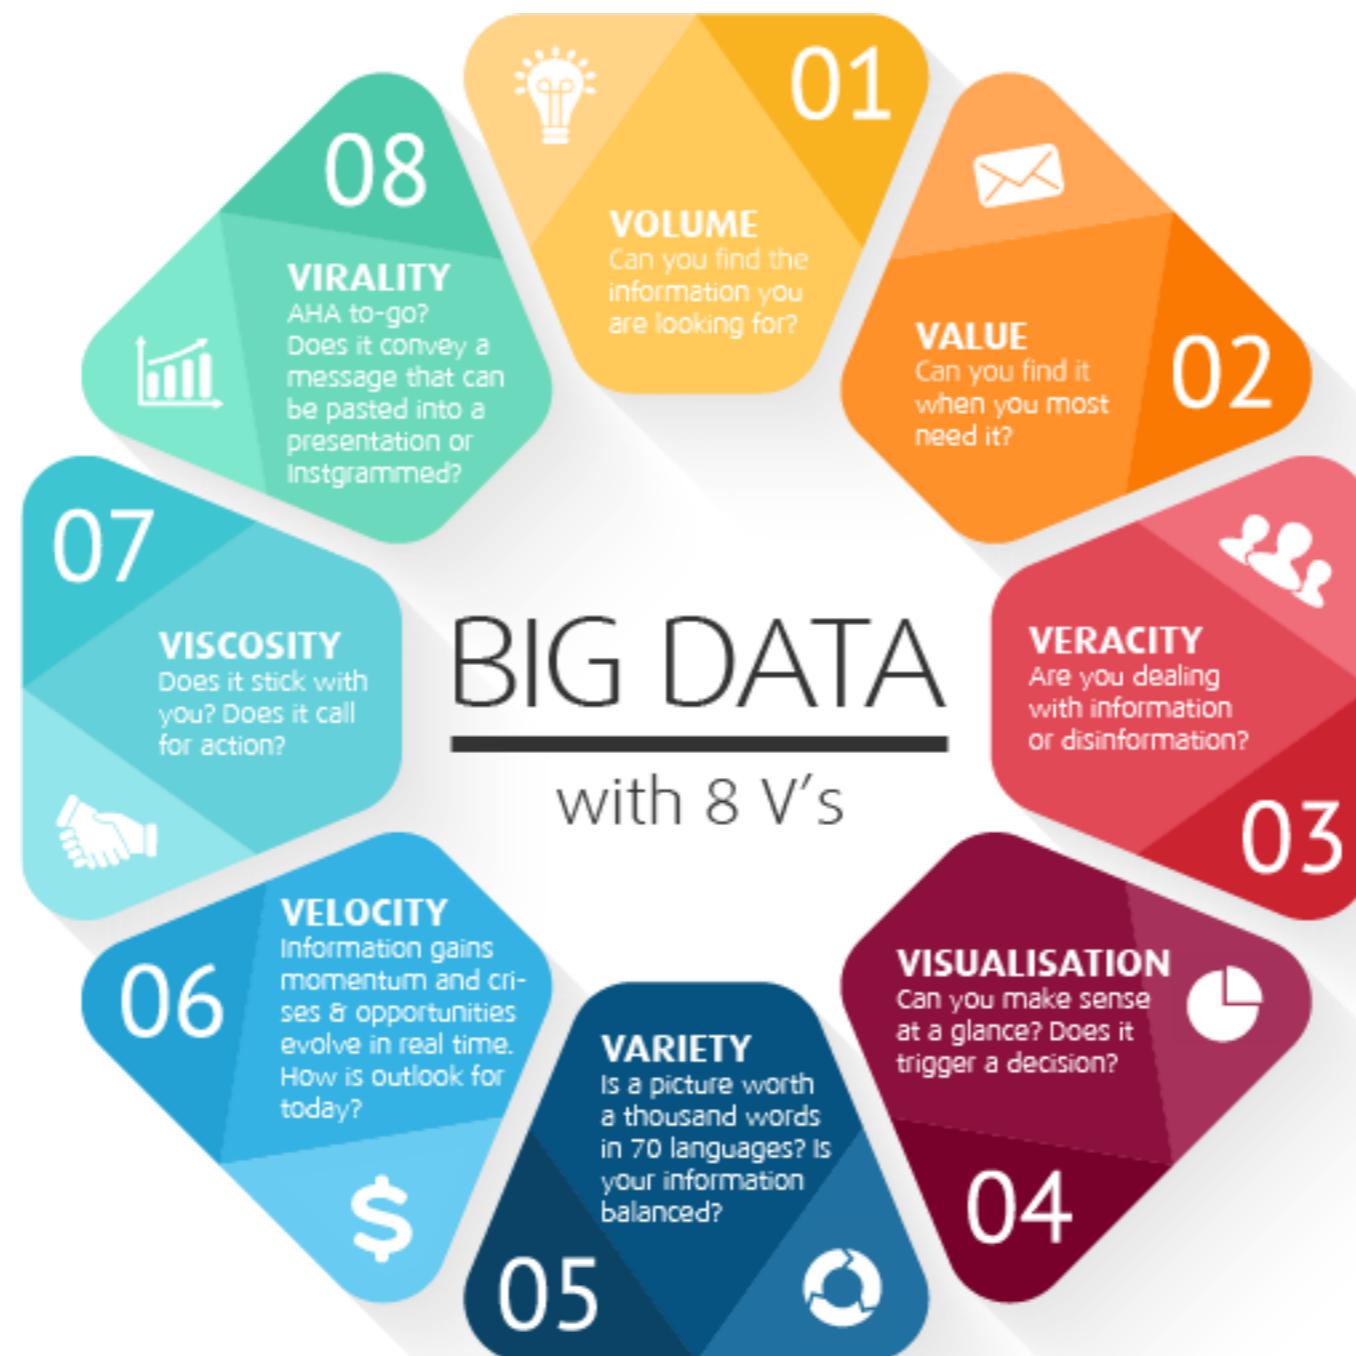

3 V's !!!

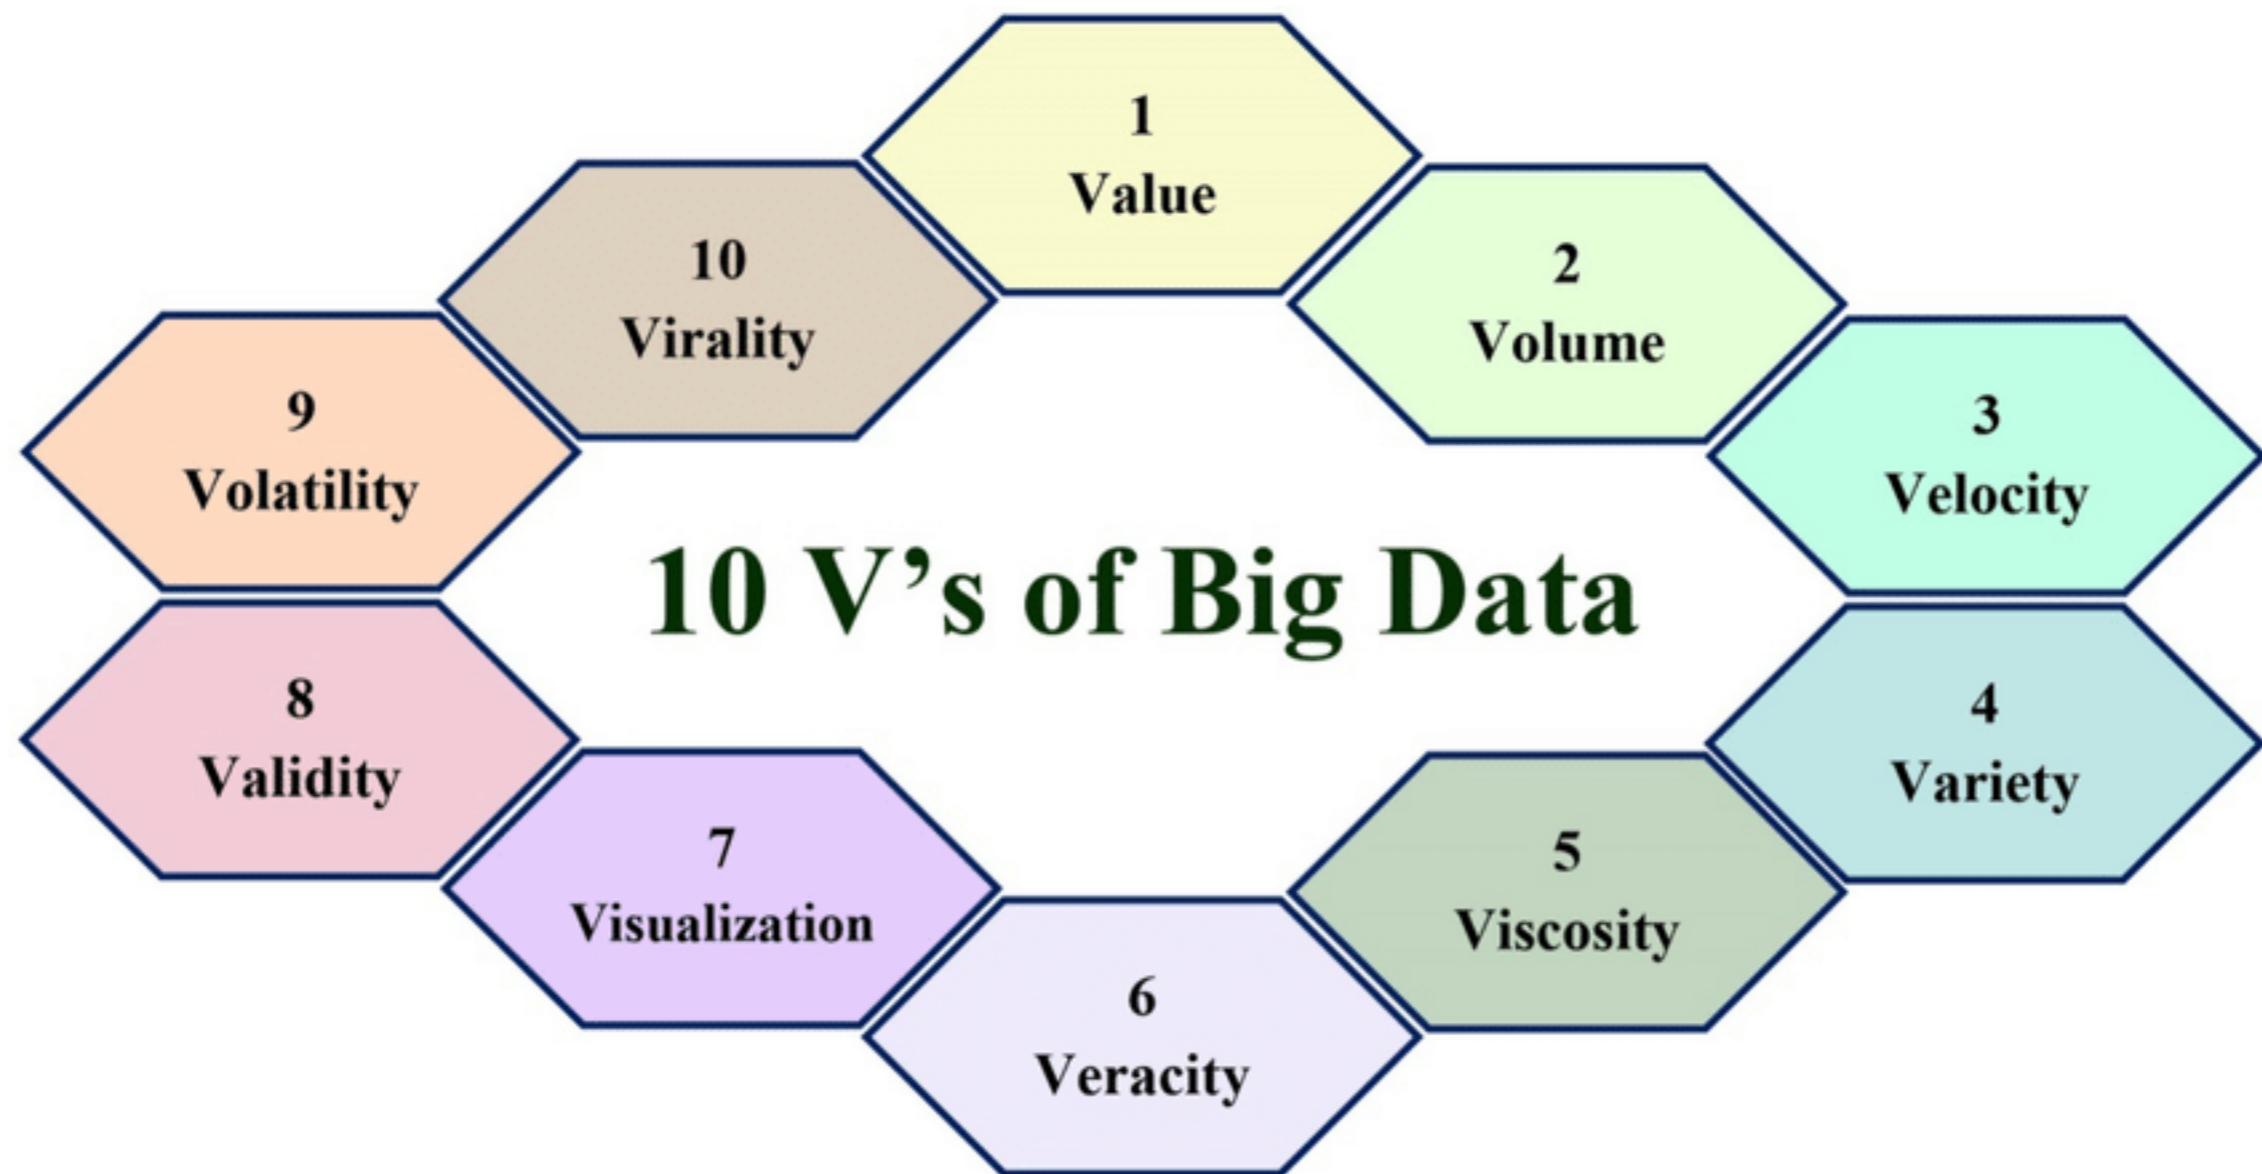

Characteristics for Big Data

Characteristics for Big Data

Characteristics for Big Data

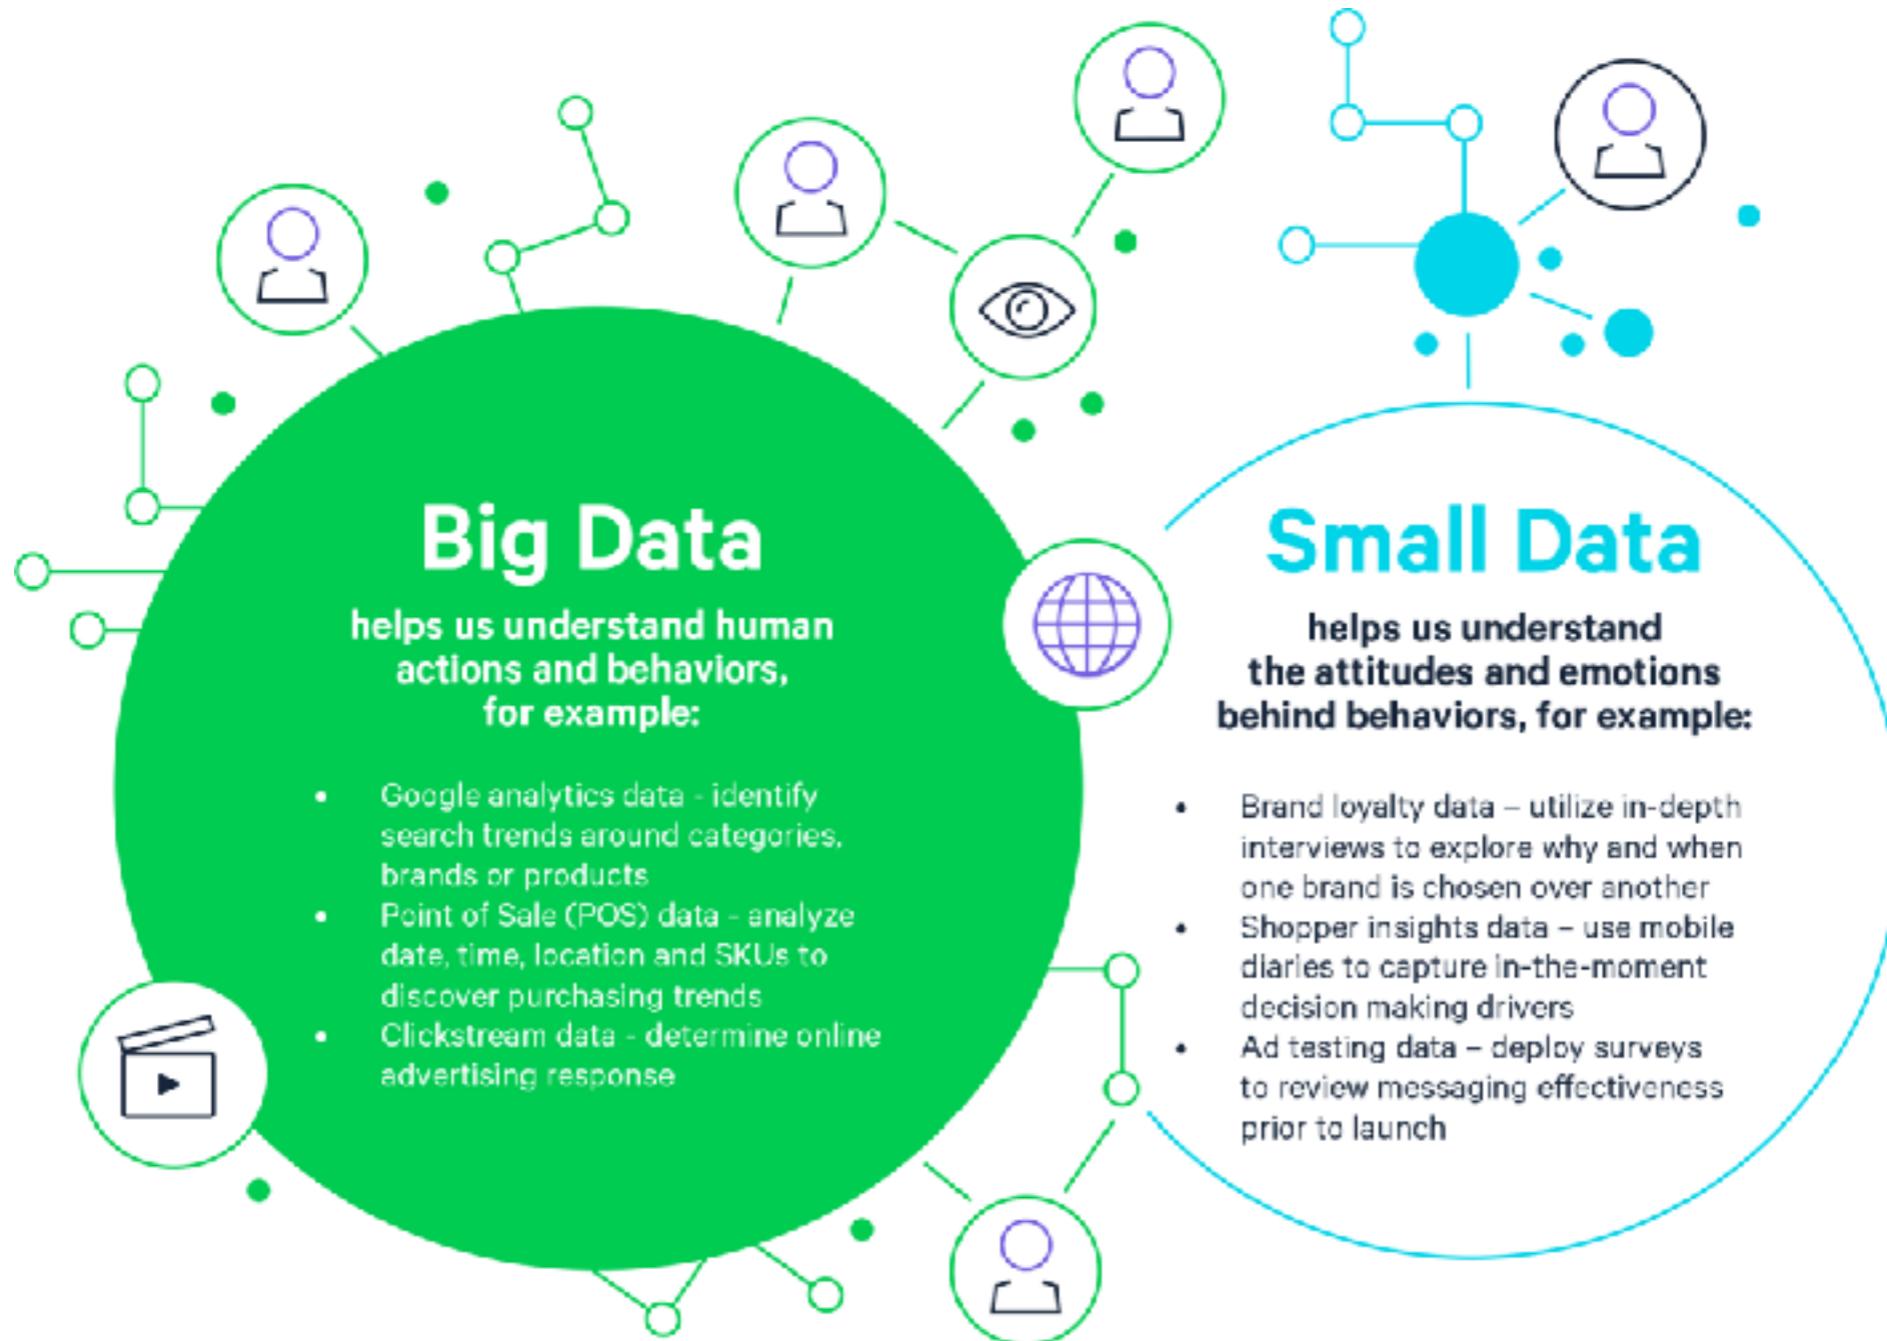

Purpose of Big Data

To extract **meaningful** information from massive datasets that conventional tools can't manage, using **advanced analytics** and data processing methods.

Big Data vs Small Data

Big Data vs Small Data

Category	Small Data	Big Data
Data Sources (แหล่งข้อมูล)	Transaction แหล่งข้อมูลจากระบบงานต่างๆ	แหล่งข้อมูลนอกเหนือจากระบบงานที่มี เช่น Log, Social Data
Volume (จำนวนข้อมูล)	Megabytes (10^6) Gigabytes (10^9) Terabytes (10^{12})	Terabytes (10^{12}) Petabytes (10^{15}) Exabytes (10^{18}) Zettabytes (10^{21})
Velocity (ความต้องการใช้ข้อมูล)	Batch, Periodic, Near Real	Real Time
Variety (ความหลากหลาย)	Structure Data	Structure Data และ Unstructure Data
Value (คุณค่าที่ได้รับ)	Analysis, Reporting หรือ Business Intelligence	Predicts (ทำนายอนาคต), หรือ Insight ใช้ Data Mining ช่วย
View (การแสดงผล)	แสดงข้อมูลโดยไม่มีการสังเคราะห์ อาจเป็นการนำข้อมูลมาแสดงผล โดยการพิจารณาขานข่ายตามประเภทสินค้า หรือตามภูมิภาค	แสดงข้อมูลที่เกิดจากการสังเคราะห์ เช่น เกิดจากการทำ Data Mining เพื่อหาความเกี่ยวข้อง หาข้อมูลที่ซ่อนอยู่

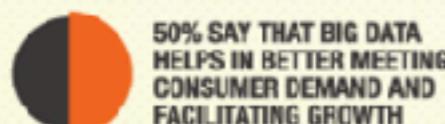

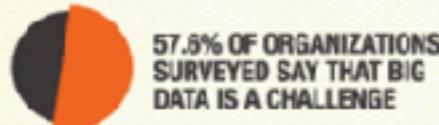

BIG DATA

Big Data is data that is too large, complex and dynamic for any conventional data tools to capture, store, manage and analyze.

The right use of Big Data allows analysts to spot trends and gives niche insights that help create value and innovation much faster than conventional methods.

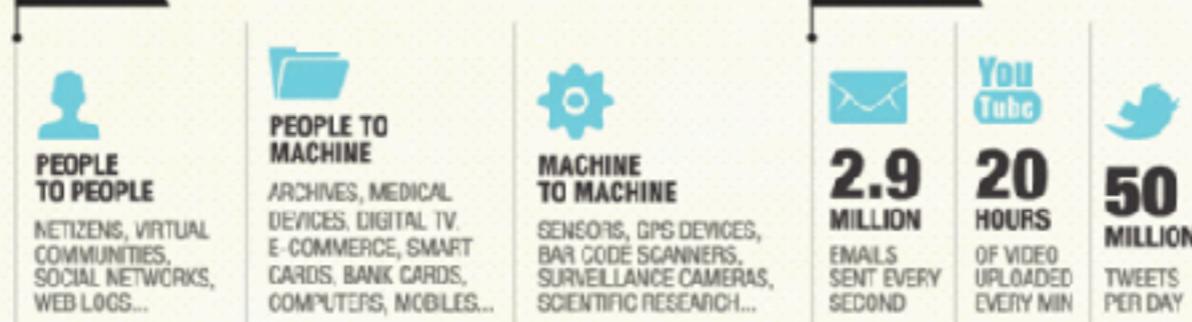

The “three V’s”, i.e the Volume, Variety and Velocity of the data coming in is what creates the challenge.

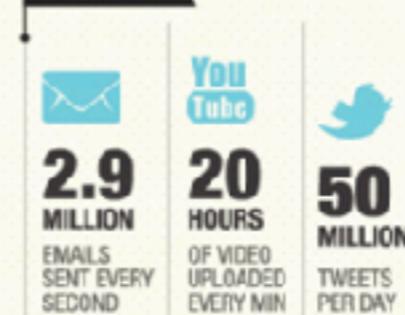

VOLUME

VARIETY

VELOCITY

CASE STUDY - Healthcare

VALUE

40% PROJECTED GROWTH IN GLOBAL DATA CREATED PER YEAR

The estimated size of the digital universe in 2011 was 1.8 zettabytes. It is predicted that between 2009 and 2020, this will grow 44 fold to 35 zettabytes per year. What is the right data management strategy for you, to successfully utilize Big Data?

Rise of Big Data Analytics

stargazr

Introduction to Business Analytics (BA)

Business Analytics (BA)

Practice of using data, statistical analysis, and quantitative methods to drive **decision-making** and **improve business outcomes**

It often involves predictive modeling, data mining, and machine learning to **forecast trends** and derive **insights**.

Purpose of BA

The goal of BA is
to help businesses make informed,
data-driven decisions by predicting
future outcomes or trends

Data-driven Decision

Make confident decisions

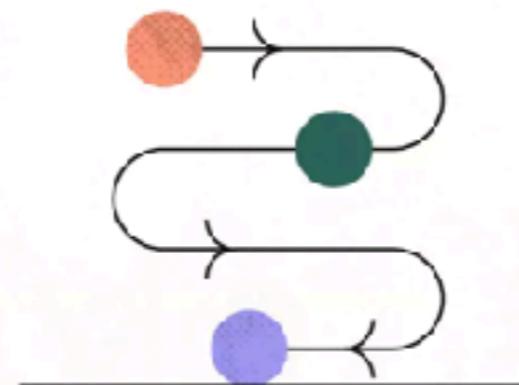

Guard against biases

Find unresolved questions

Set measurable goals

Improve company processes

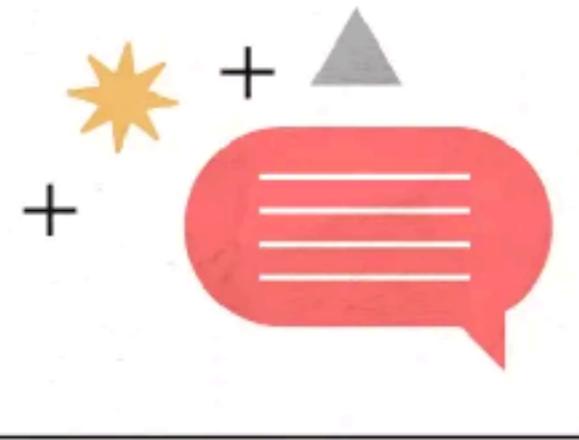

<https://asana.com/resources/data-driven-decision-making>

Tips for Data-driven Decision

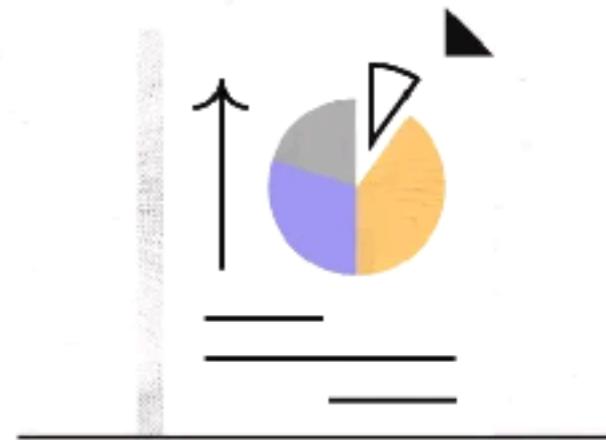

Find the story

When analyzing data, look for patterns and meanings behind the numbers and figures.

Consult the data

Before making any gut decisions, see if the facts align with your feelings.

Learn data visualization

Make sure your data is visually appealing and easy to understand.

<https://asana.com/resources/data-driven-decision-making>

Key Techniques

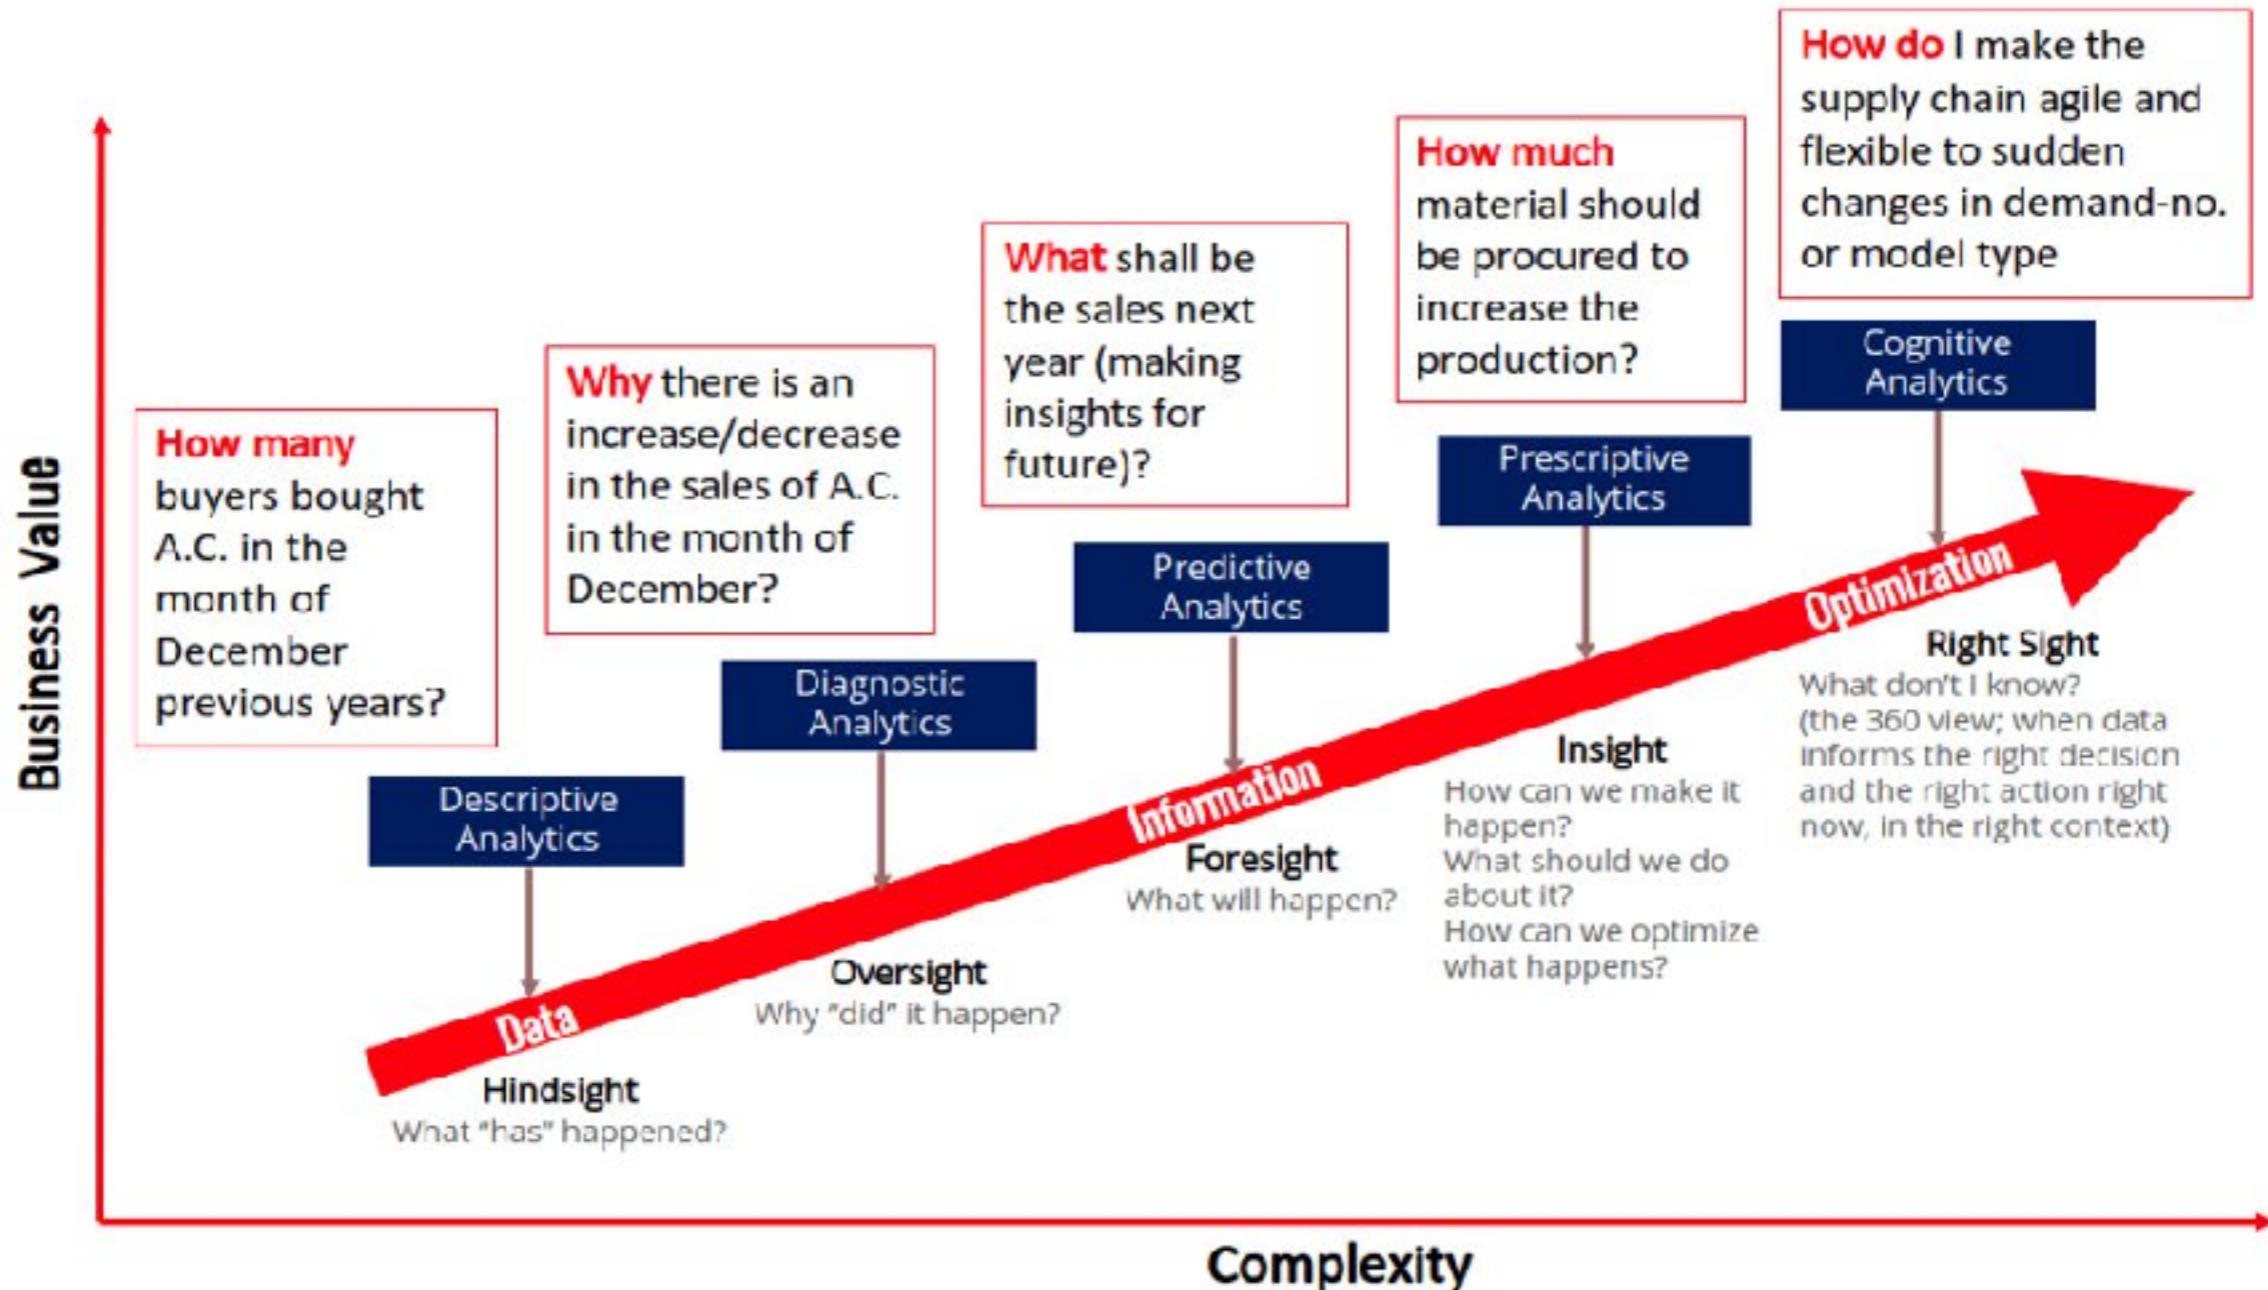

Predictive
Analytics

Prescriptive
Analytics

Diagnostic
Analytics

Key Techniques

Descriptive Analytics

Descriptive analytics answers the question,

“What happened?”

by summarizing historical data to identify patterns
and trends.

Descriptive Analytics

It helps businesses understand **past performance** and gain insights from historical data to determine what has occurred over a given period.

Basic data aggregation

Reporting tool

Data visualisation tool

Statistic and trend

Diagnostic Analytics

Diagnostic analytics answers the question,

“Why did it happen?”

by analyzing data to understand
the root causes of past events.

Diagnostic Analytics

It digs deeper into descriptive analytics to find the reasons behind specific outcomes or patterns.

Drill-down
analytics

Correlation
analysis

Root cause
analysis

Statistic with
regression analysis

Predictive Analytics

Predictive analytics answers the question,

“What will likely happen in the future?”

by using historical data, statistical models, and machine learning techniques to forecast future trends.

Predictive Analytics

It helps businesses anticipate **future outcomes** based on patterns and trends found in historical data.

Statistic
modeling

Machine learning
algorithm

Time series
forecast

Predictive Analytics

Prescriptive Analytics

Prescriptive analytics answers the question,

“What should be done?”

by recommending specific actions
or strategies to achieve desired outcomes or
optimize processes.

Prescriptive Analytics

It goes beyond predicting future outcomes by suggesting the best course of action based on predictions.

Optimization
model

Simulation

Decision/scenario
analysis

Summary

Type	Main Question	Purpose	Techniques	Example
Descriptive Analytics	What happened?	Understanding past performance.	Data aggregation, reporting, visualization	Sales reports showing performance by region.
Diagnostic Analytics	Why did it happen?	Identifying causes of past outcomes.	Drill-down analysis, correlation, root cause	Analyzing why sales declined in a certain area.
Predictive Analytics	What will happen?	Forecasting future trends and outcomes.	Machine learning, statistical models	Predicting customer churn for an online store.
Prescriptive Analytics	What should we do?	Recommending actions to optimize future outcomes.	Optimization, simulation, decision models	Suggesting optimal pricing strategies for sales.

Summary

Descriptive Analytics

focuses on summarizing what has already happened

Diagnostic Analytics

helps businesses understand why those things happened

Predictive Analytics

forecasts future trends based on historical data

Prescriptive Analytics

provides recommendations to optimize decision-making and future outcomes

Introduction to Business Intelligence (BI)

Business Intelligence (BI)

Refers to technologies, applications, and practices used for the collection, integration, analysis, and presentation of business data.

Collect

Integrate

Analysis

Visualize

Purpose of BI

**BI is about reporting and dashboards
that help businesses monitor their current state
and past performance
by organizing data into actionable insights.**

Characteristics for Big Data

3 V's !!!

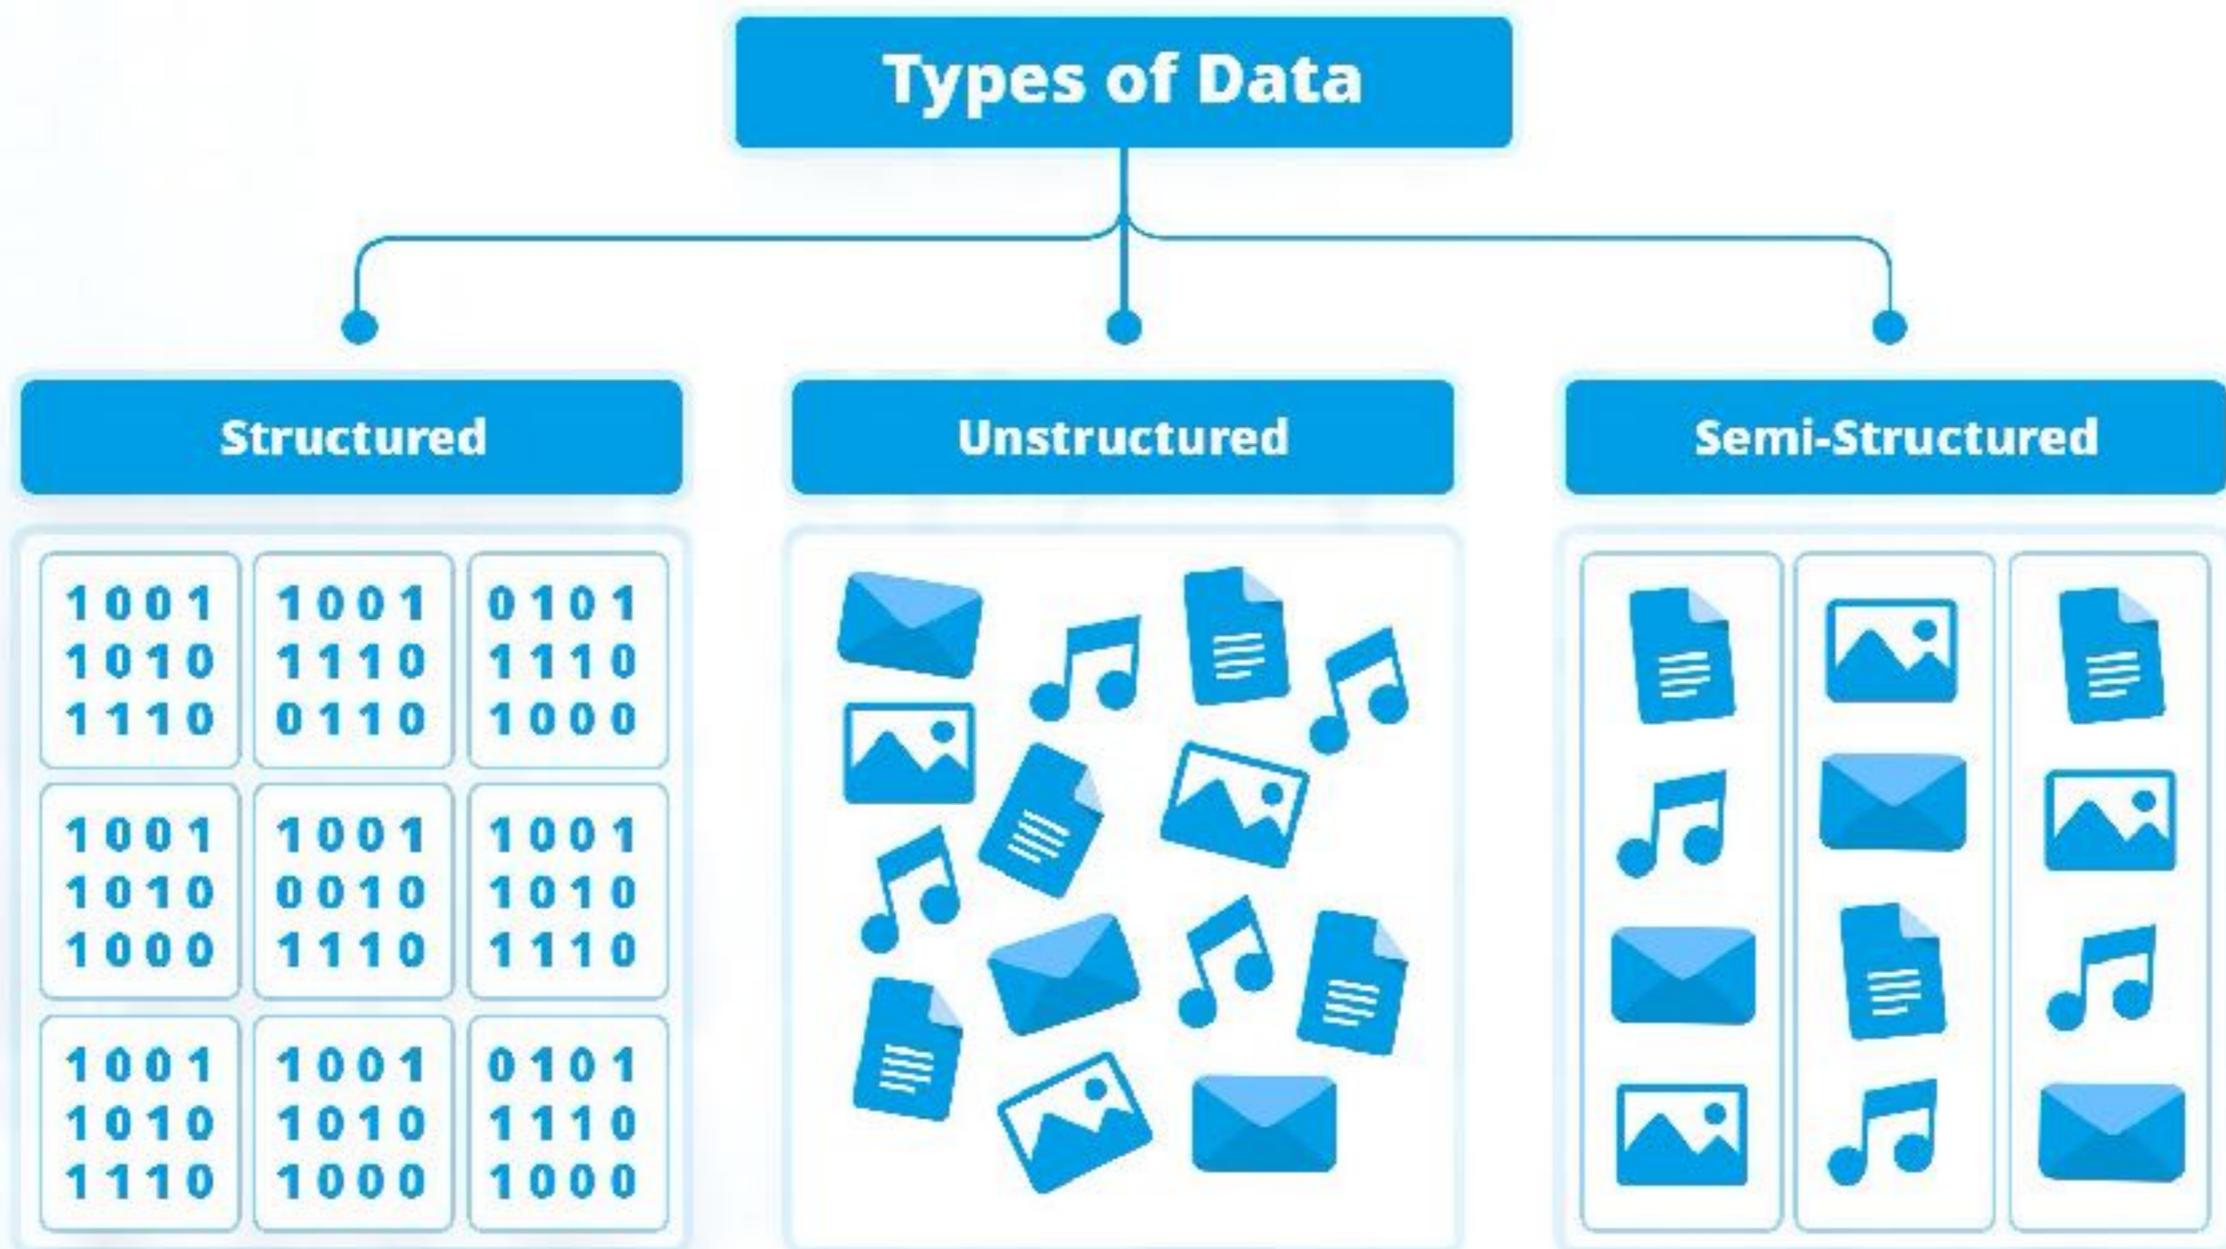

Types of data sources

Structured
Unstructured
Semi-structured

Types of data

Astera
Enabling Data-Driven Innovation

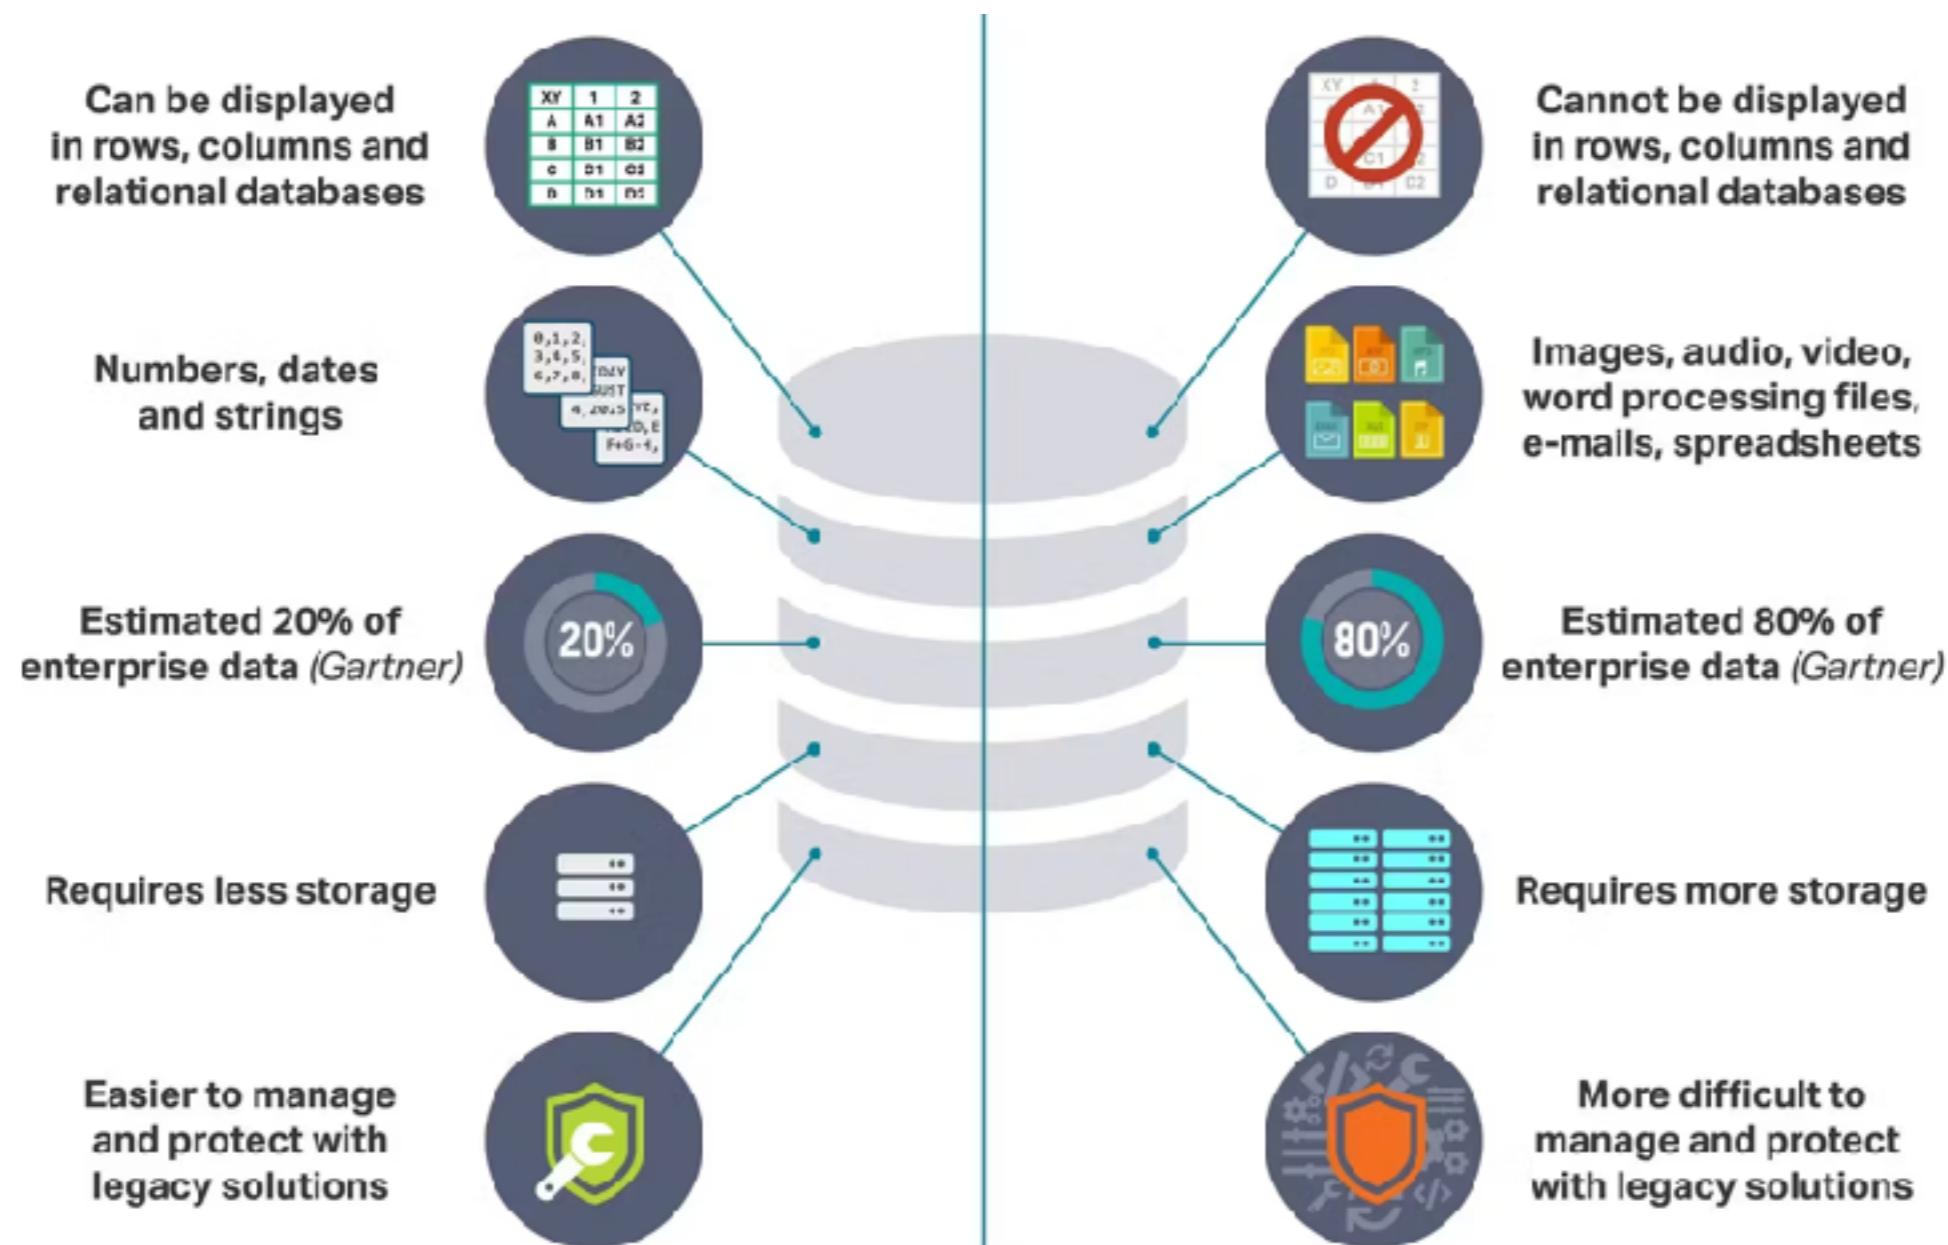

Types of data sources

Feature	Structured Data	Unstructured Data	Semi-structured Data
Definition	Data organized in a predefined format with a clear structure	Data lacking a predefined format and organization	Data with some internal structure but lacking a rigid schema
Examples	Relational databases, spreadsheets, CSVs, APIs	Text documents, emails, images, videos, social media posts	JSON files, XML files, log files
Characteristics	Standardized format, easily searchable and analyzable, consistent and reliable	Diverse formats, challenging to process and analyze, rich and diverse information	Flexible format, adaptable to evolving data needs, requires specialized tools
Advantages	Easy to process and analyze, supports efficient data retrieval, suitable for statistical analysis	Rich and diverse information, captures real-world context, valuable for sentiment analysis and trend identification	Adaptable to evolving data needs, flexible and scalable, suitable for real-time applications
Disadvantages	Limited flexibility, unable to capture complex relationships, not suitable for all types of data	Difficult to process and analyze, requires specialized tools, data quality concerns	Limited data integration potential, lack of standardized formats, evolving data structures
Use Cases	Business intelligence, financial transactions, scientific research, data warehousing	Customer feedback analysis, social media monitoring, content analysis, multimedia processing	Real-time analytics, sensor data analysis, web scraping, scientific experiments
Tools and Techniques	SQL databases, spreadsheets, data warehouses, data analytics tools	Natural language processing (NLP), machine learning, sentiment analysis, image recognition	JSON parsers, XML parsers, stream processing tools, data pipelines

Structured vs Unstructured data

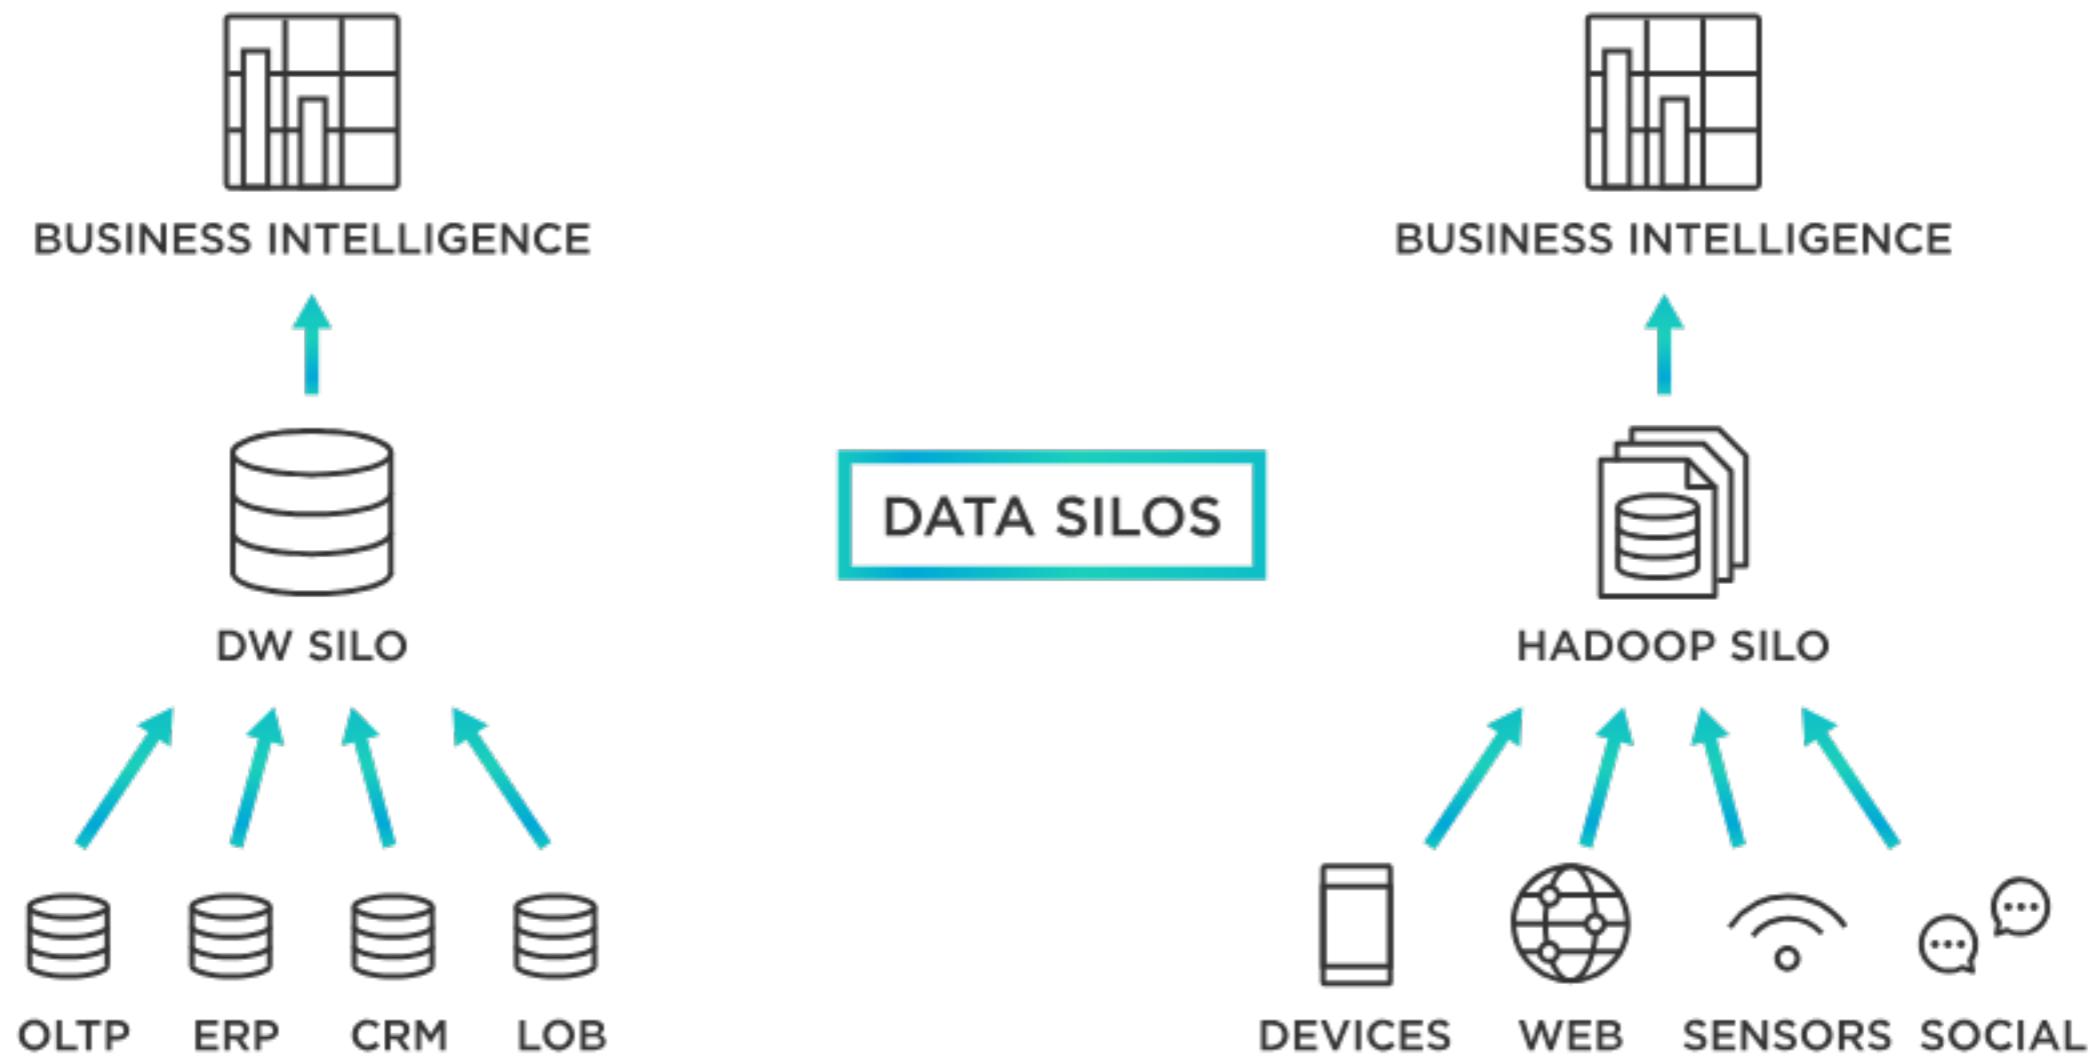

Unstructured Data Challenges

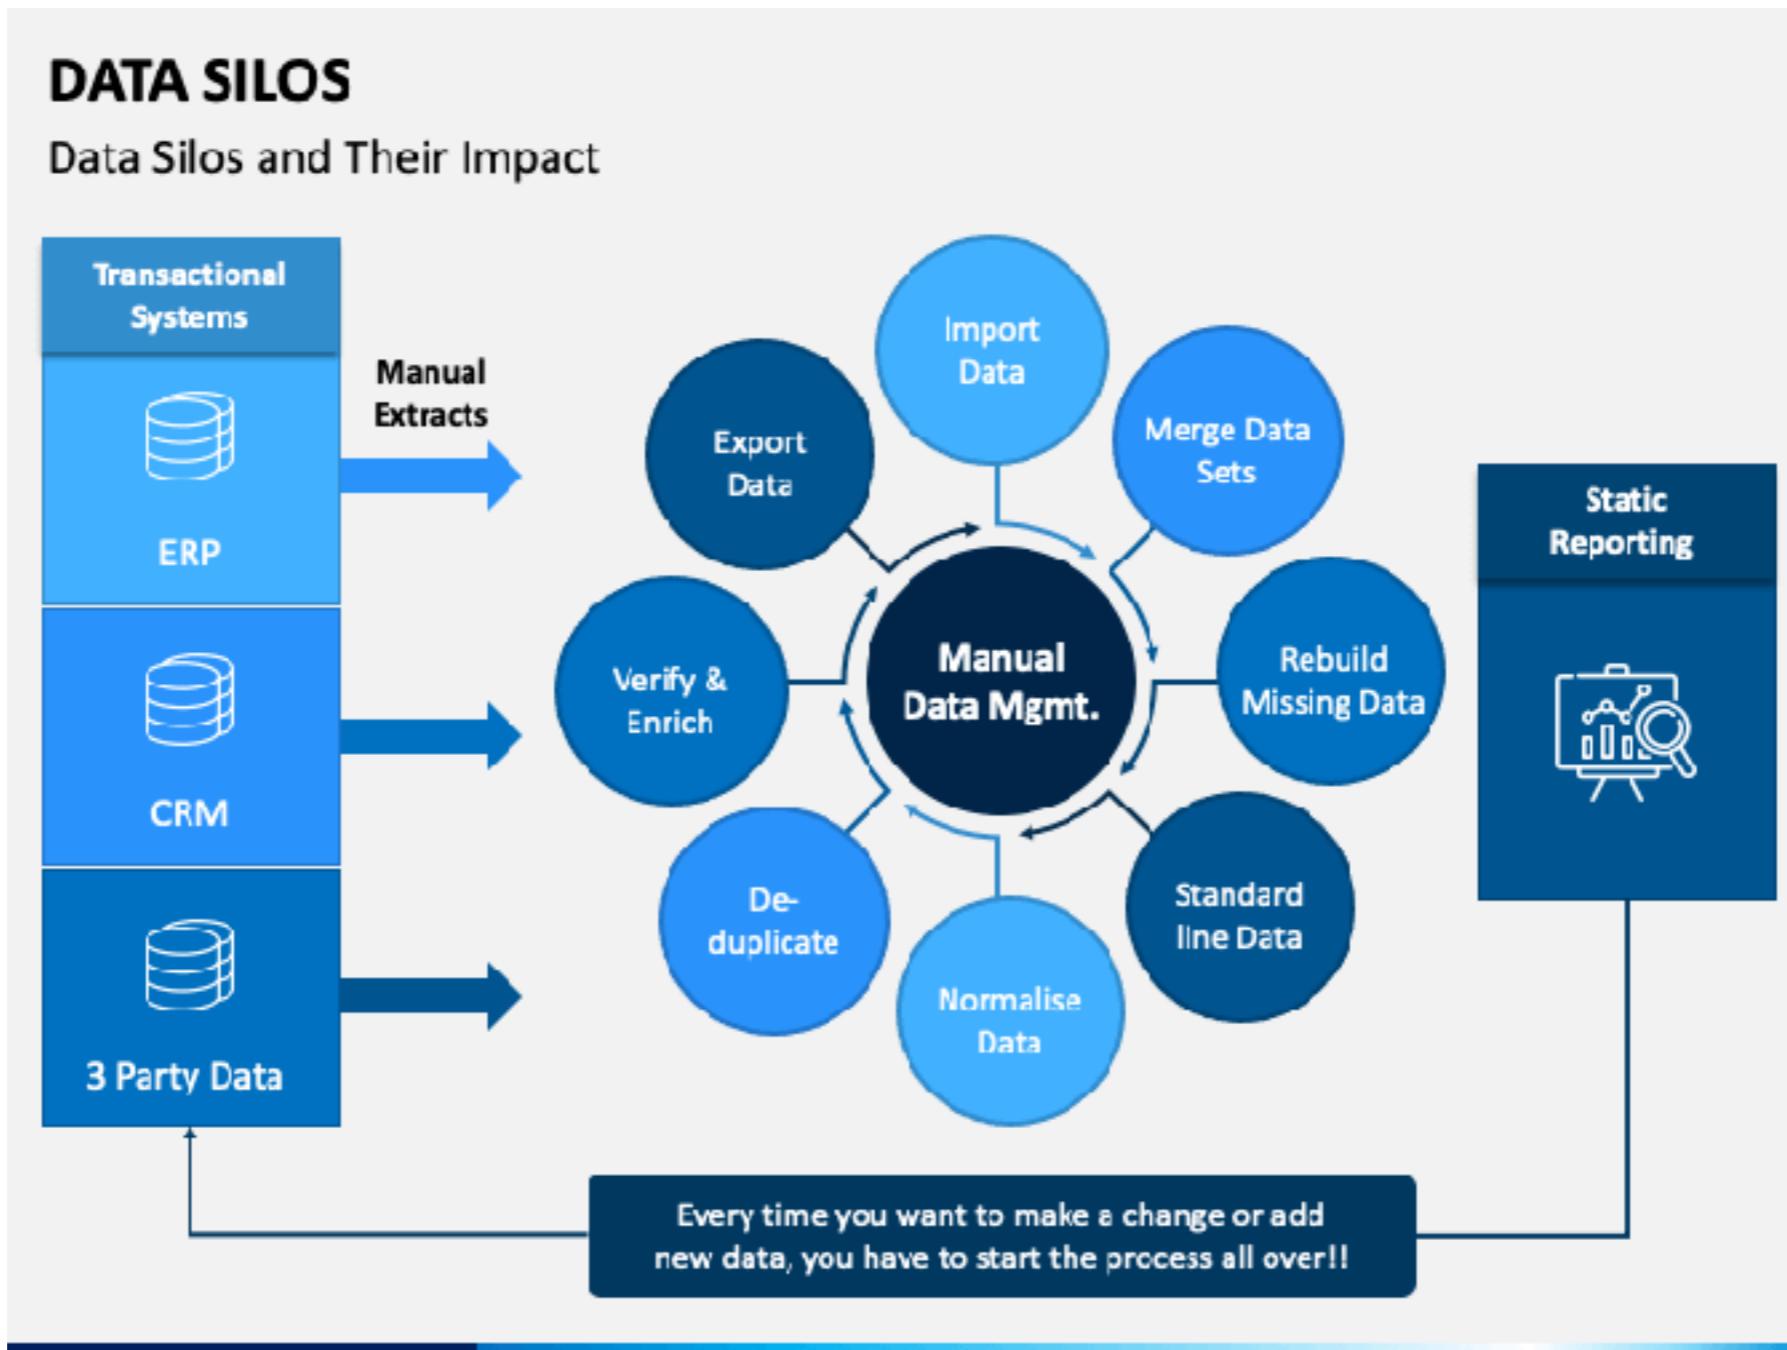

Inability to process growing data volumes
Accessing **siloed** data
Regulatory non-compliance
Reduced data usability
Increased vulnerability to cyber attacks

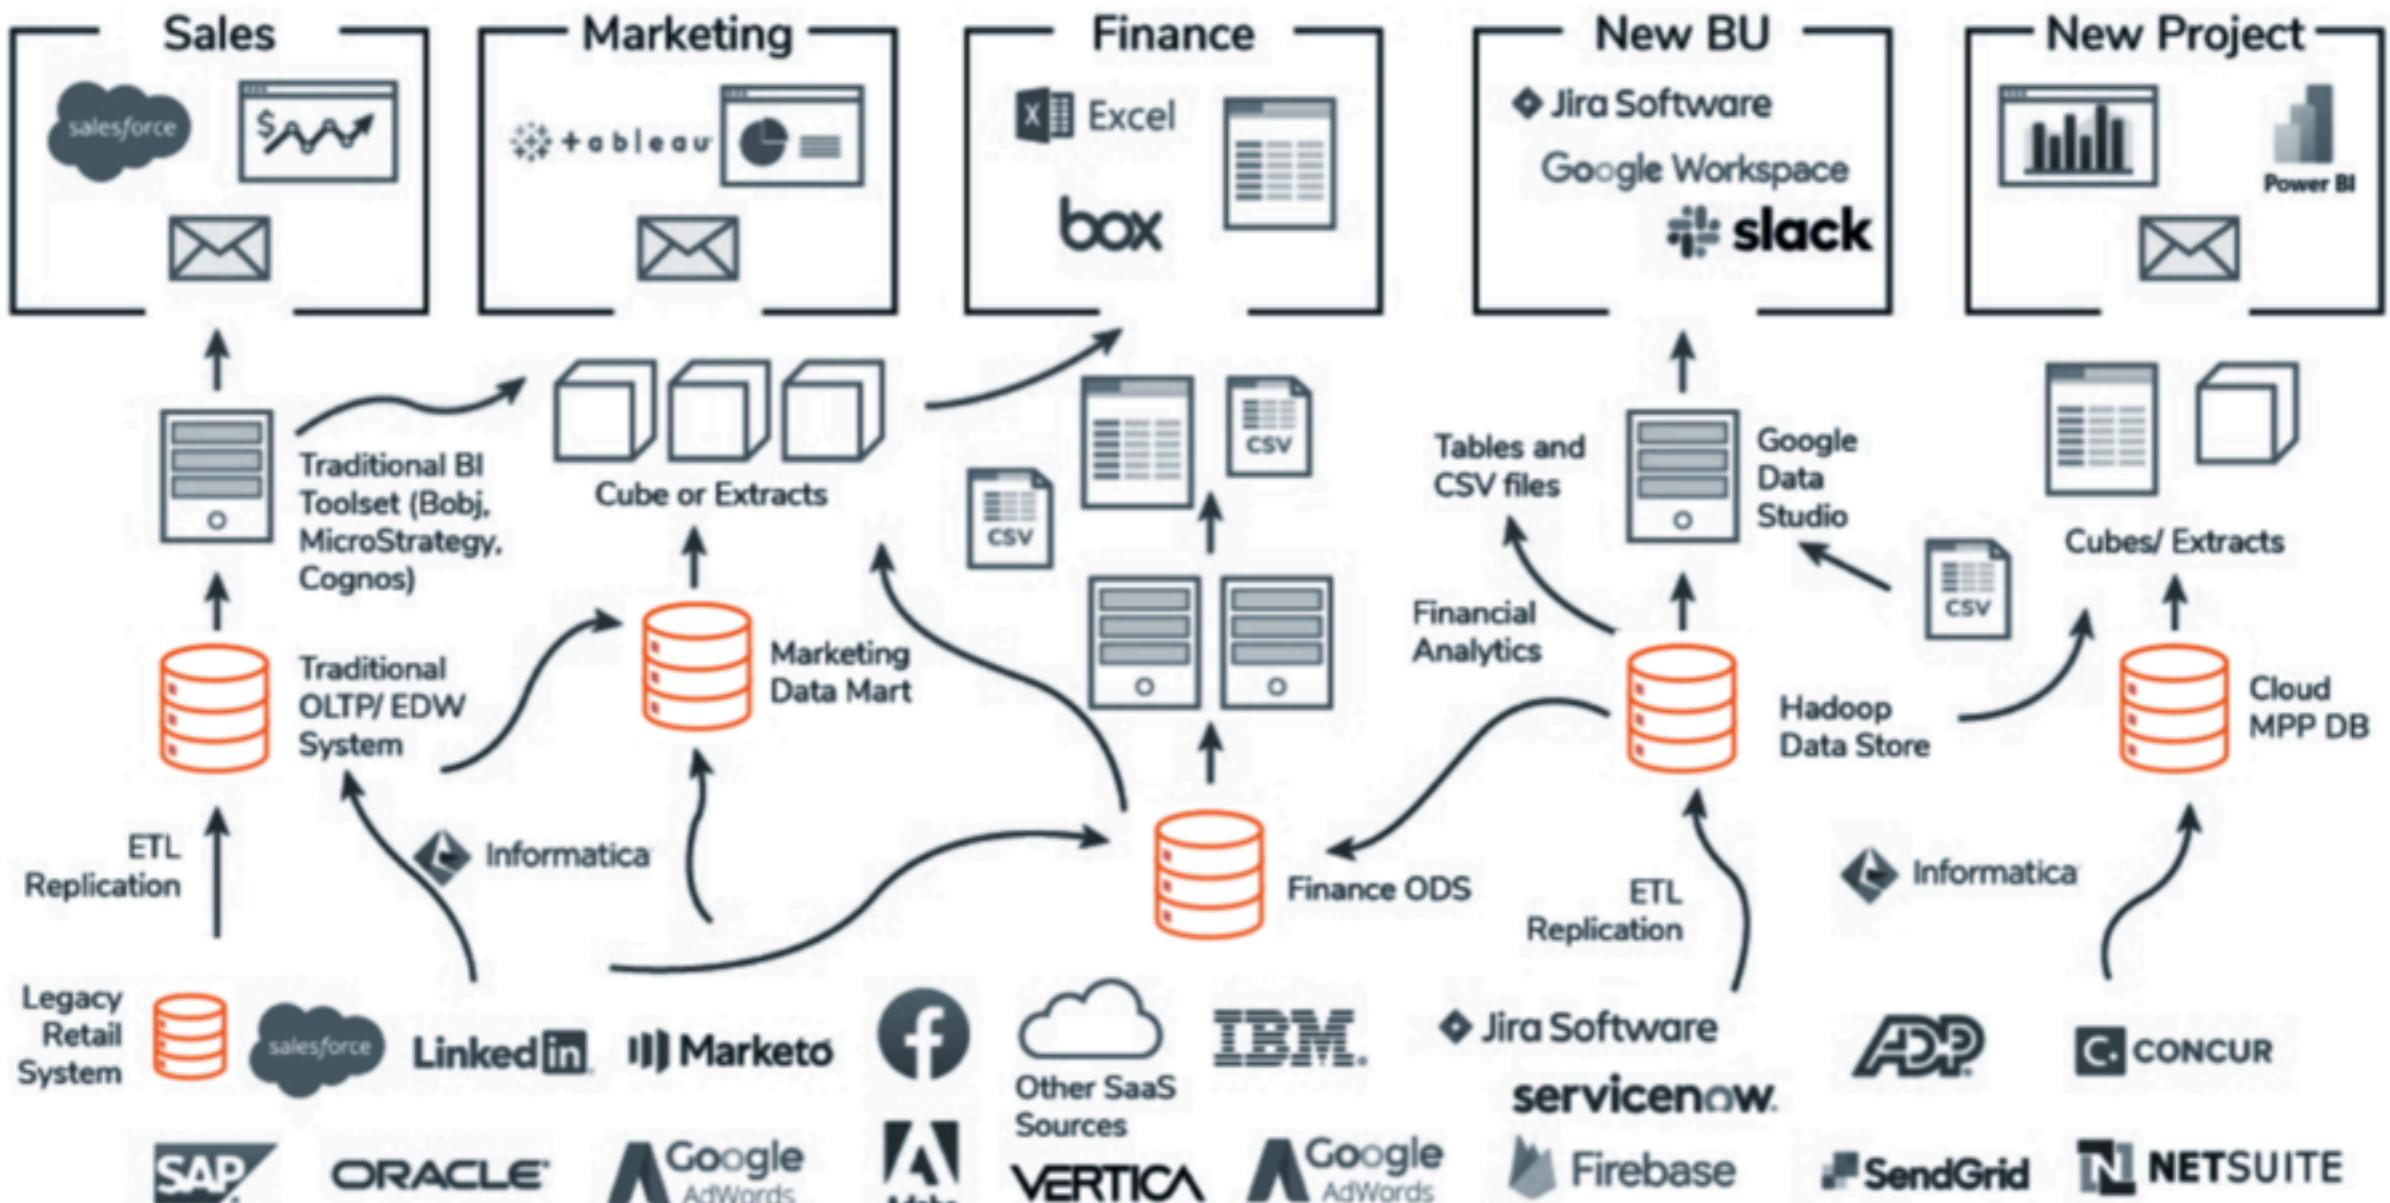

Data siloed ?

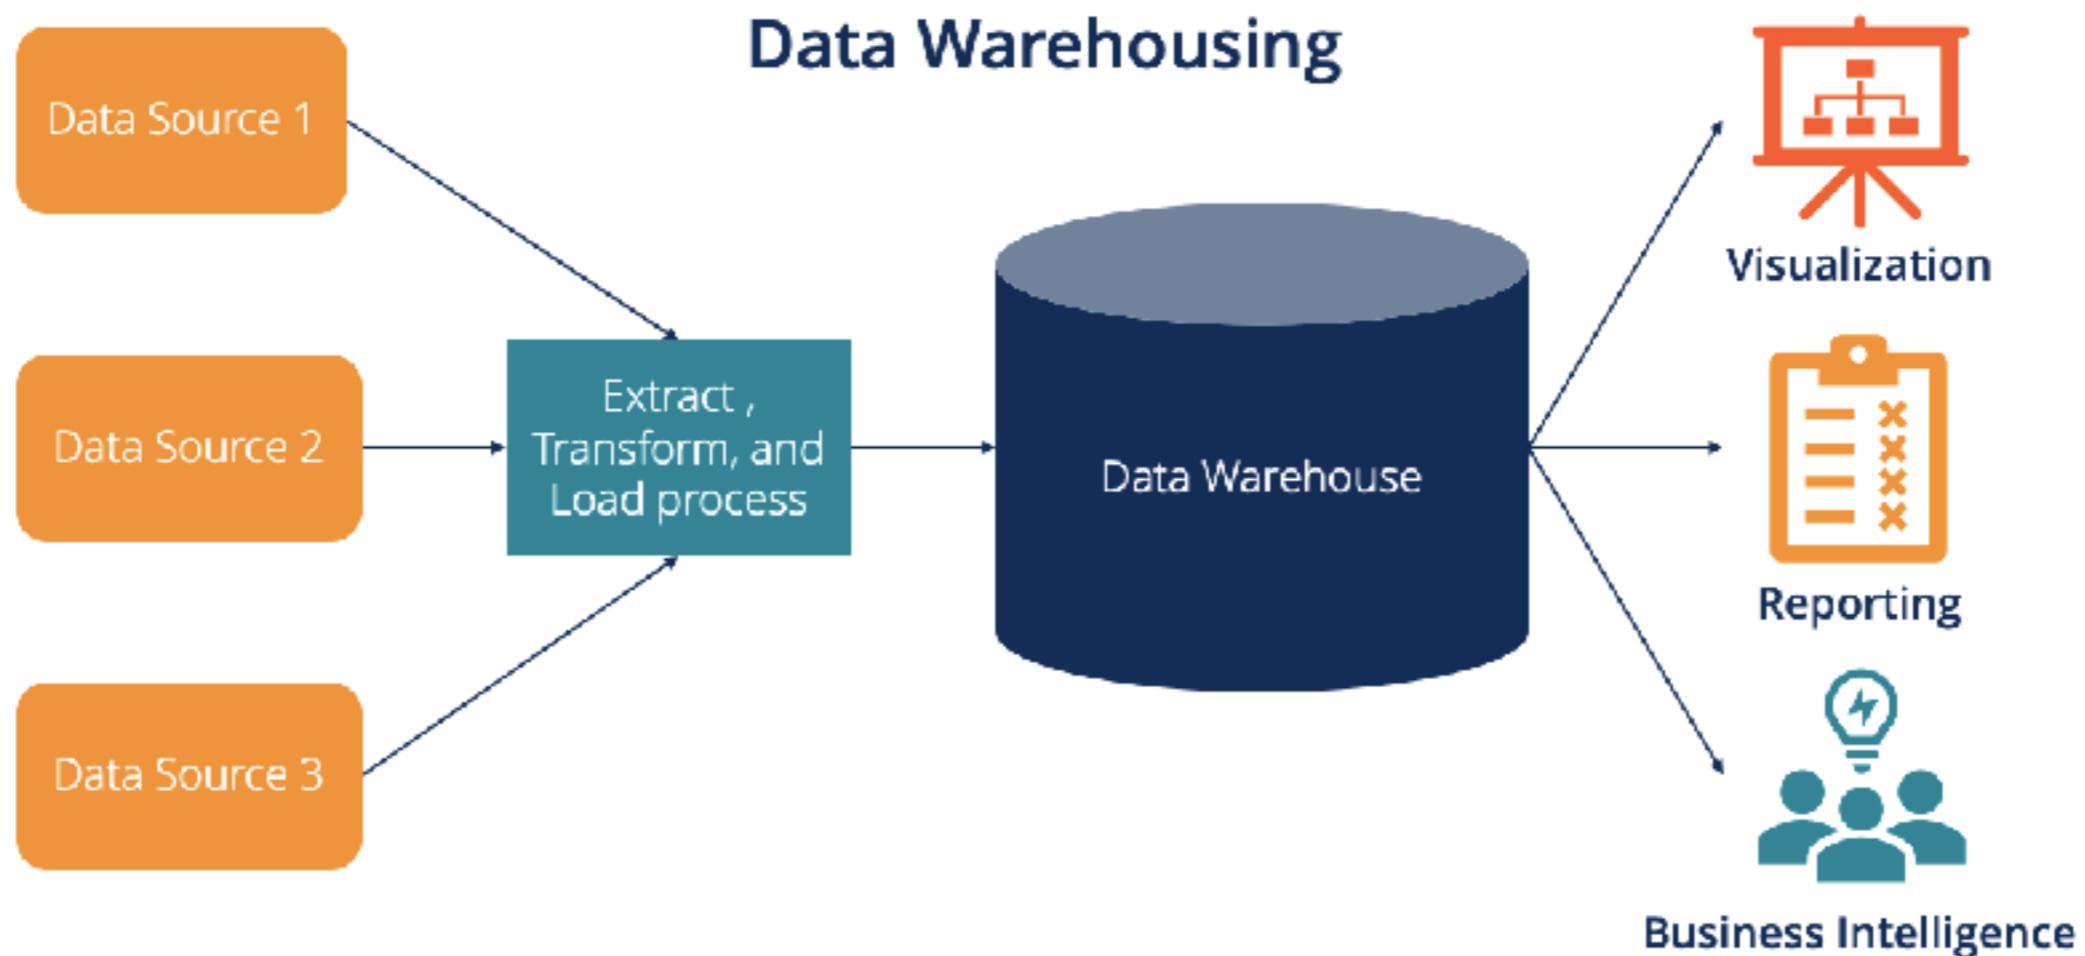

Data siloed ?

Data siloed ?

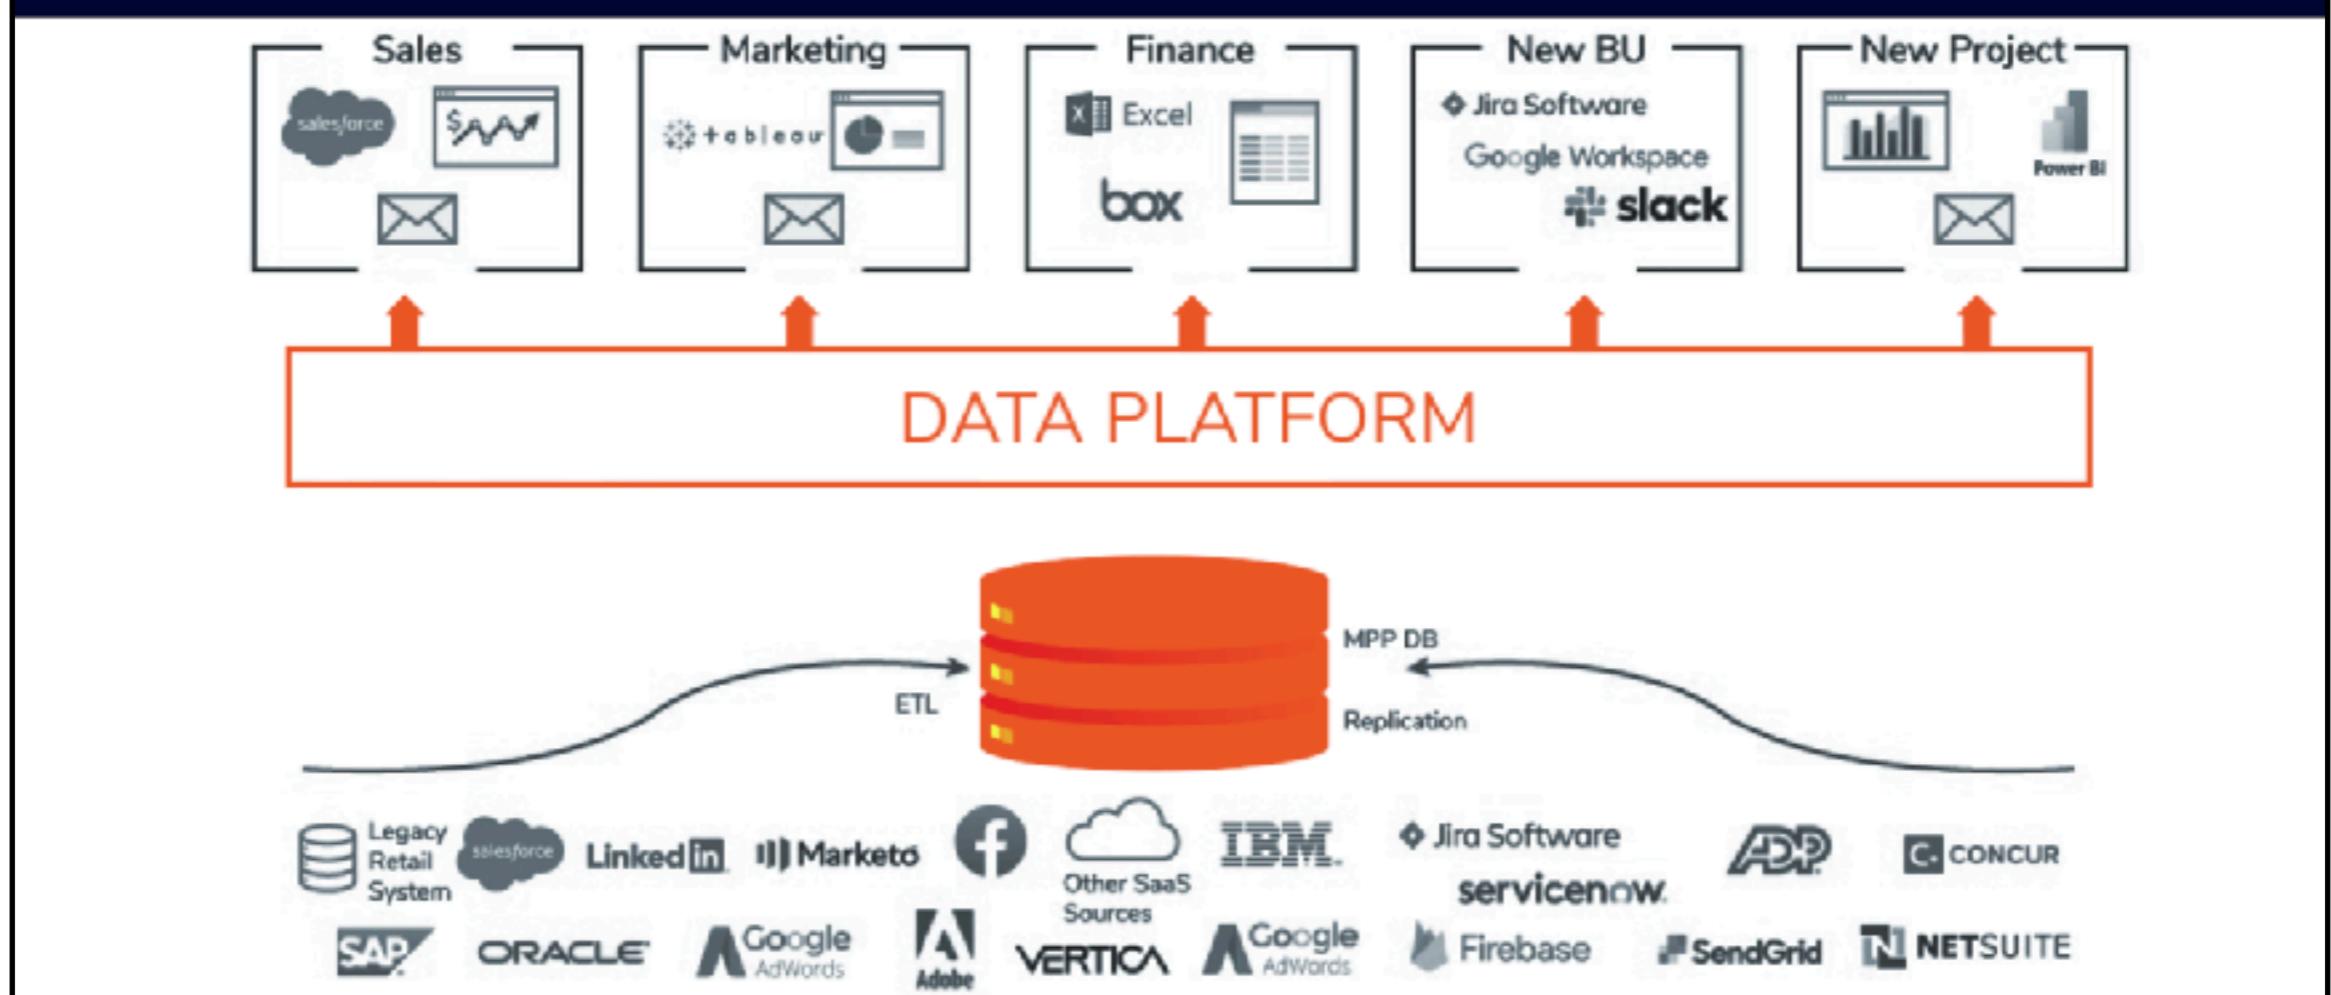

Try to solve with data platform

Data analysis

Data storage ?

Database

Data
Warehouse

Data Mart

Data Lake

Data Warehouse

A data warehouse is a centralized repository that stores **structured** and processed data from **multiple sources**.

It is optimized for querying and analysis, primarily used for reporting, business intelligence, and decision-making.

Data Mart

A data mart is a smaller, **more focused subset of a data warehouse**, designed to serve the needs of a **specific business unit or department** (e.g., sales, marketing).

It contains only relevant data for that particular group, **enabling quicker access and more tailored analysis**.

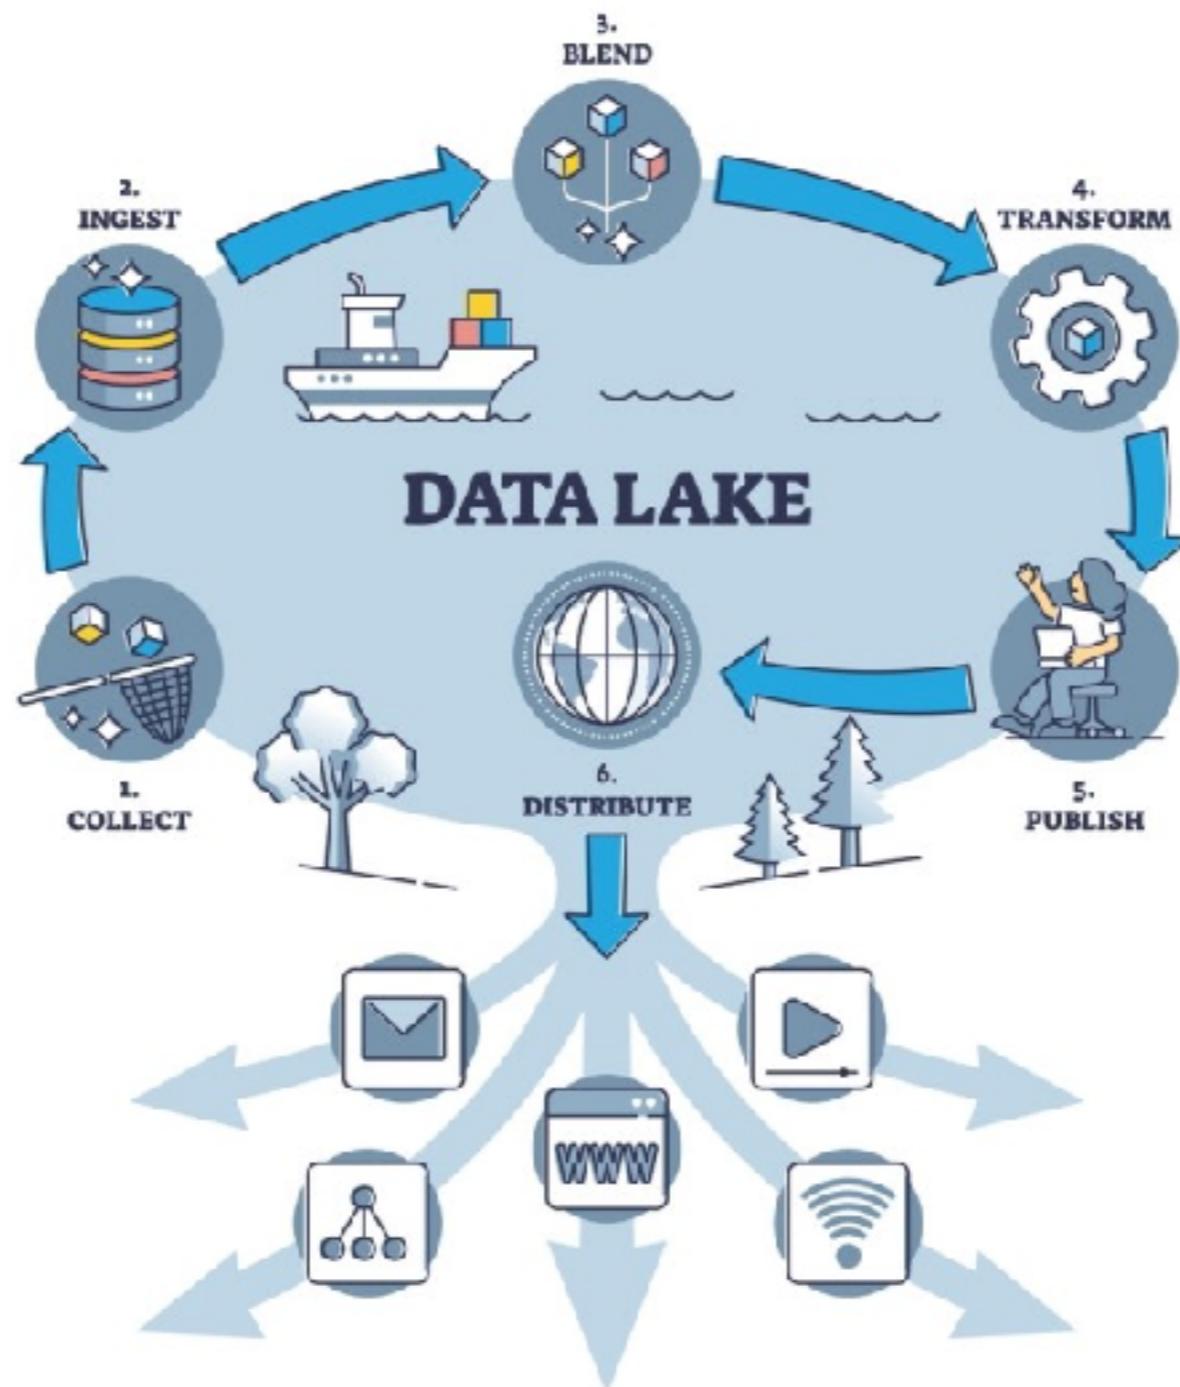

Data Lake

A data lake is a **vast storage** repository that holds a large amount of raw data in its **native format** (structured, semi-structured, and unstructured) until it is needed for analysis.

It is designed for **storing data** before it is processed and transformed for analysis, offering flexibility and scalability.

Data Lake

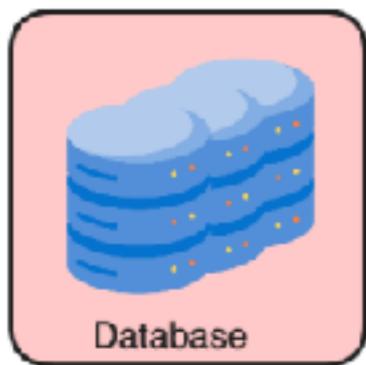

Key differences

Feature	Data Warehouse	Data Mart	Data Lake
Data Type	Structured	Structured	Structured, semi-structured, and unstructured
Scope	Enterprise-wide (broad)	Department-specific (narrow)	Enterprise-wide (but raw)
Storage Type	Structured (rows/columns)	Structured	Raw format
Data Processing	Pre-processed (ETL)	Pre-processed (ETL)	Raw, processed when queried
Primary Use	Reporting, historical analysis	Department-specific insights	Big data analysis, machine learning
Speed of Query	Fast for complex queries	Faster for localized queries	Slower for complex queries
Cost	Generally more expensive	Less expensive than data warehouse	Cheaper for storage, but processing may incur costs
Schema	Schema-on-write	Schema-on-write	Schema-on-read

Data pipeline

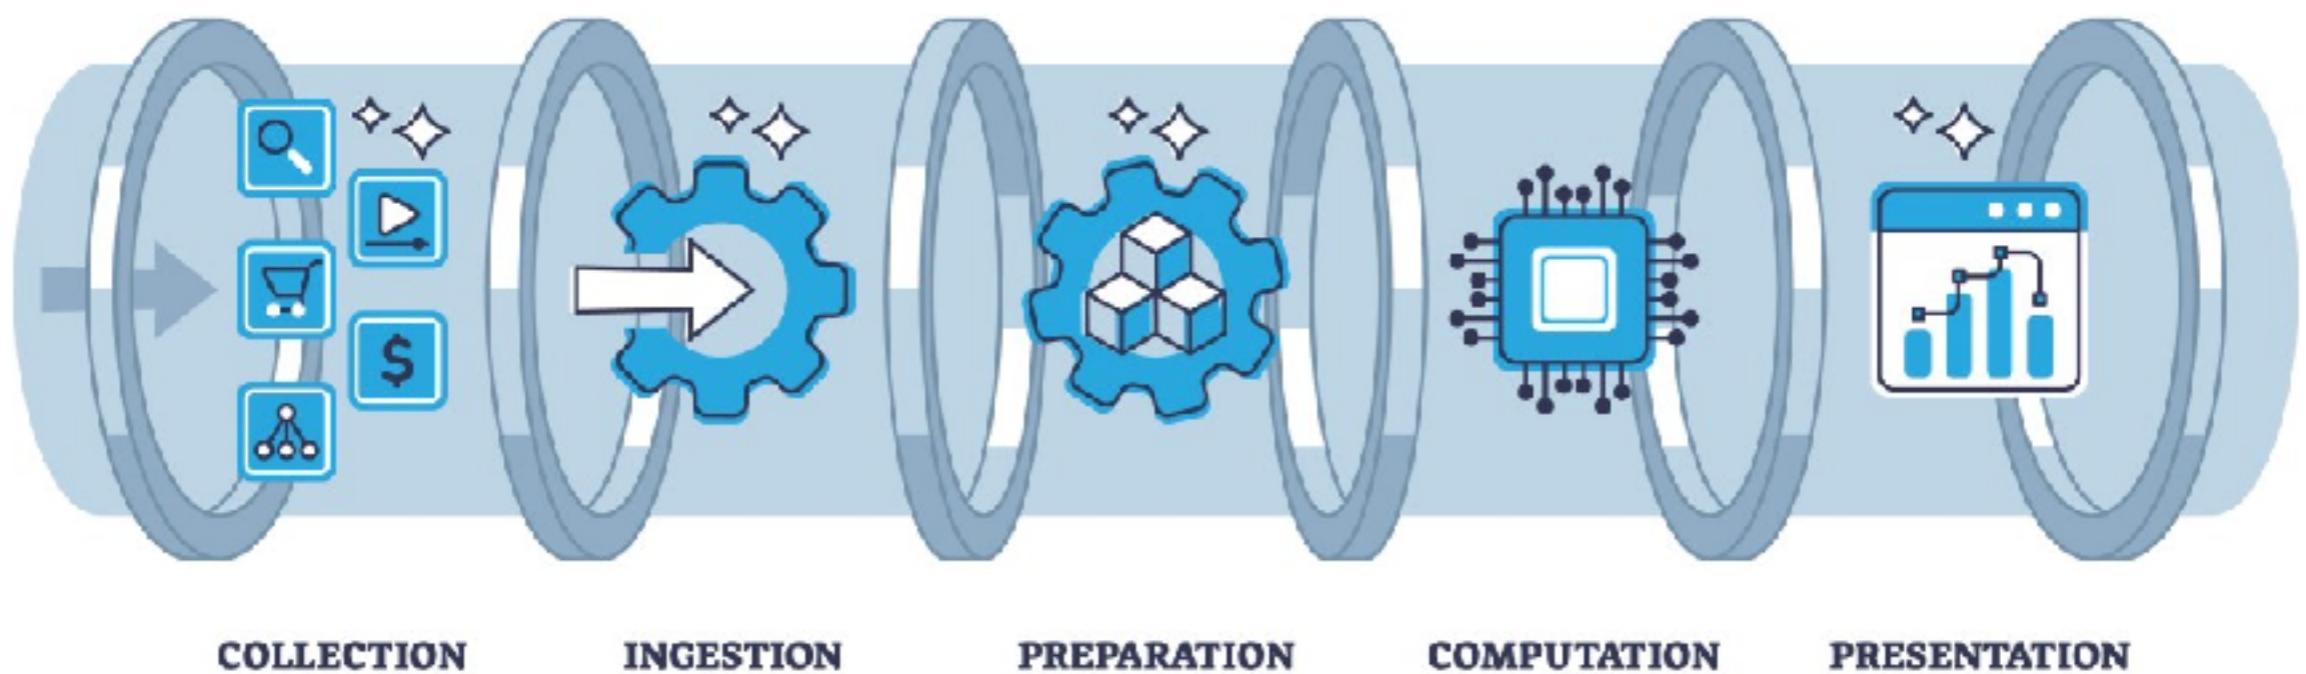

Data pipeline

A **data pipeline** refers to a series of **processes** and tools used to automate the flow of data from source systems to destination systems, such as databases, data lakes, or data warehouses.

Data pipeline

Data Ingestion

The process of collecting data from various sources and bringing it into the pipeline.

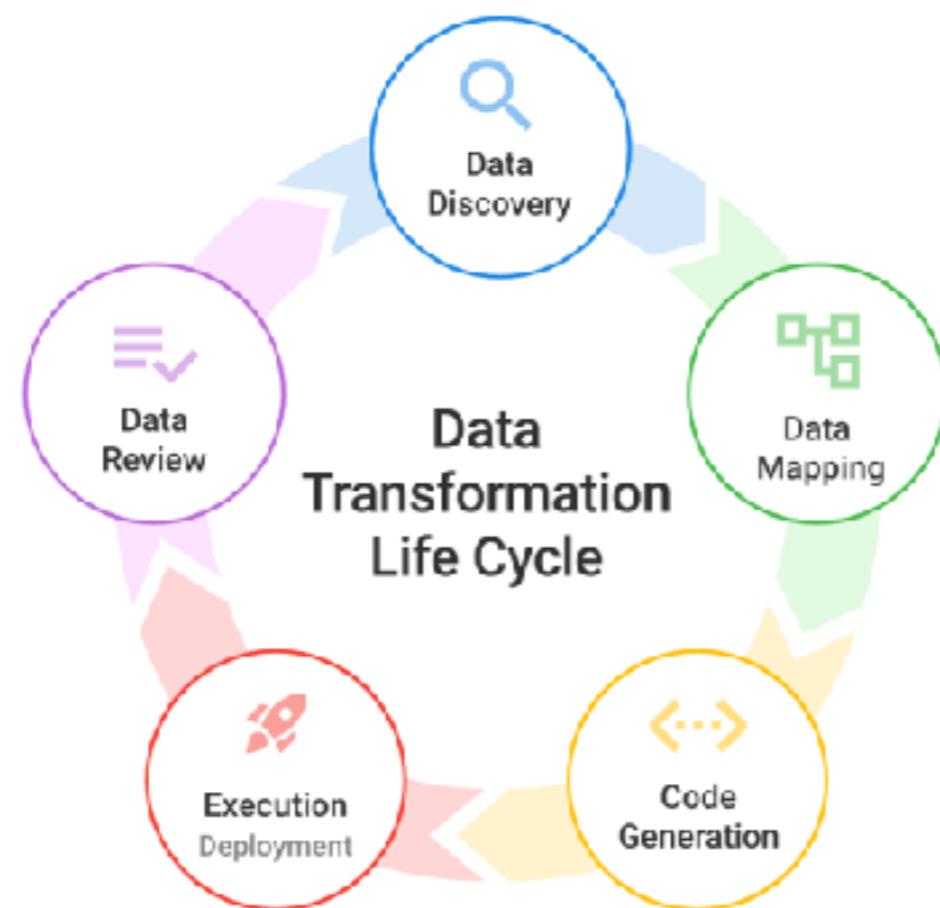

Batch
processing

Real-time
processing

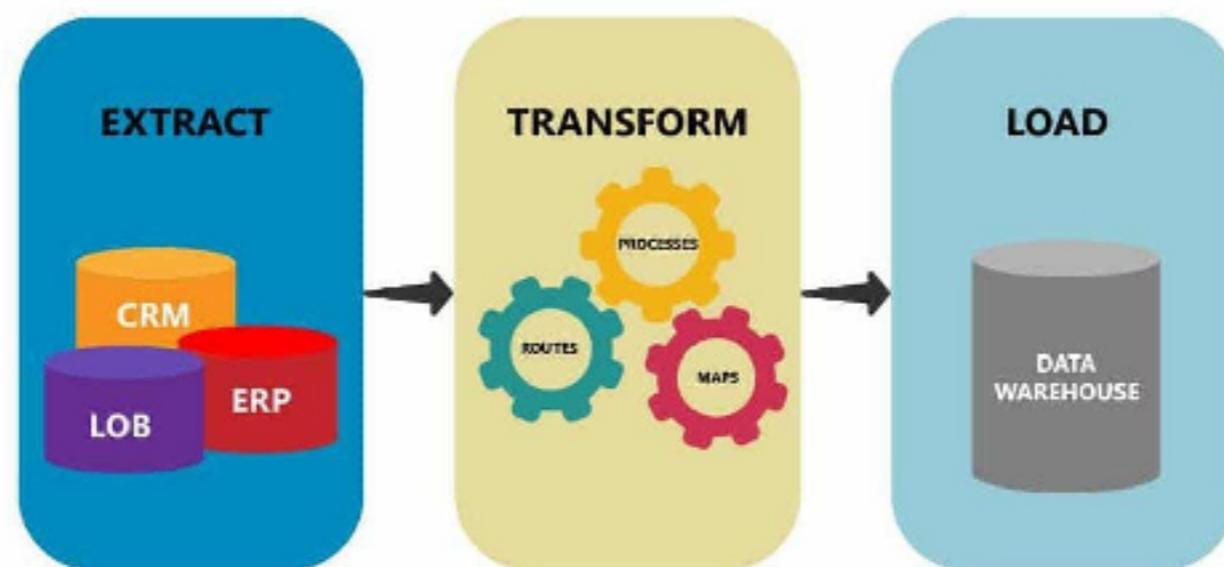

Data Transformation

This step involves cleaning, validating, and transforming the data into a standardized format or structure suitable for analysis or storage.

Data Loading

The transformed data is loaded into a target destination, which could be a data warehouse, database, or cloud storage platform.

Orchestration

This component **manages the overall workflow** and scheduling of the pipeline, ensuring the proper execution and coordination of data processing tasks.

Big Data Analysis Techniques

Exploratory Data Analysis (EDA)

John W. Tukey

EXPLORATORY DATA ANALYSIS

Objectives of EDA :

- Suggest hypotheses about the causes of observed phenomena
- Assess assumptions on which statistical inference will be based
- Support the selection of appropriate tools and techniques
- Provide a basis for further data collection through surveys or experiments

John Tukey,
Exploratory Data Analysis
(New York: Pearson, 1977)

Exploratory Data Analysis

Critical step in the **data science process** that involves summarizing the main characteristics of a dataset, often using visual methods, before applying more formal **statistical techniques**.

Summarize

Visualize

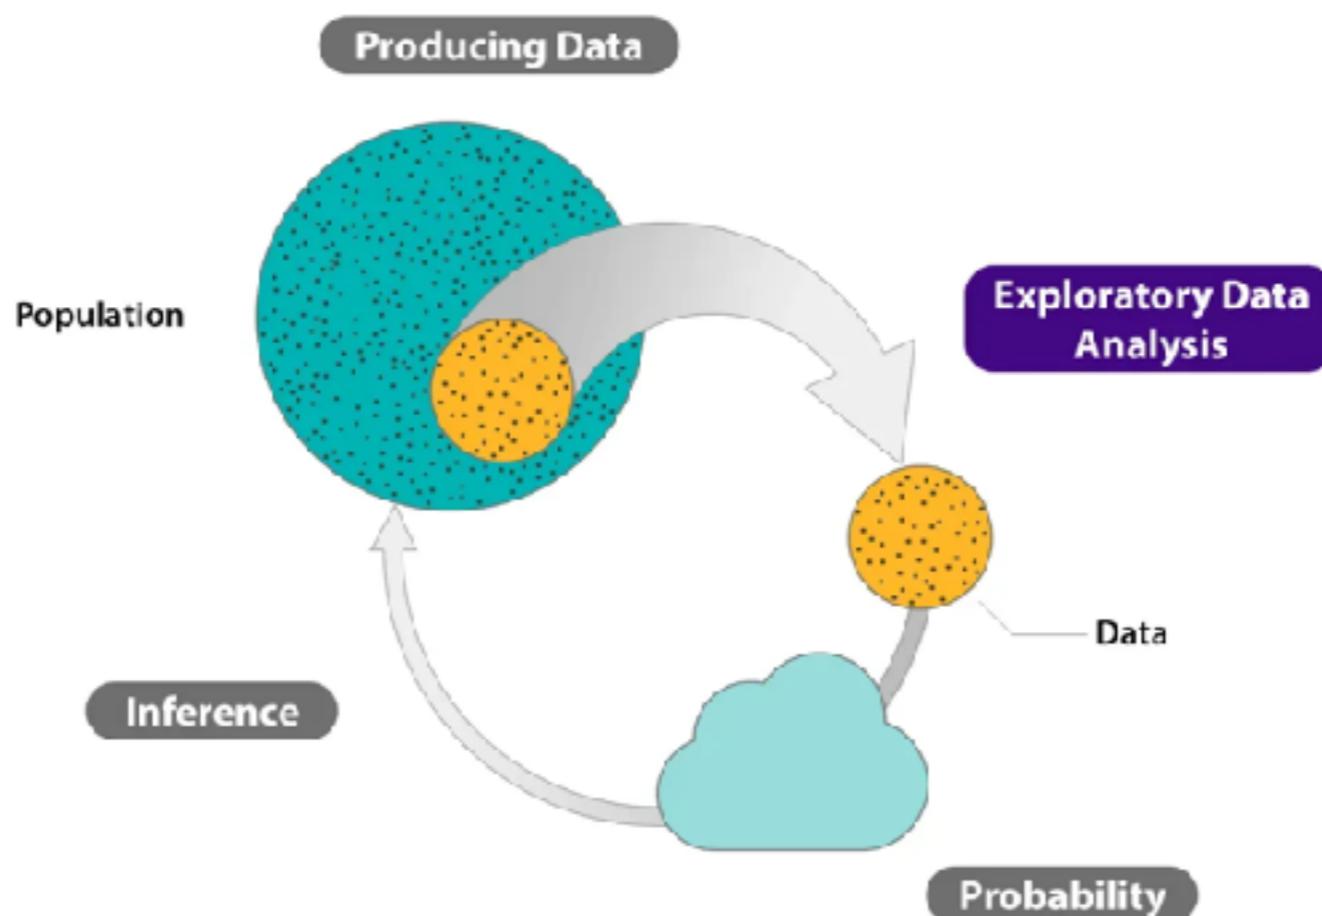

Identify

Missing data/values

Exploratory Data Analysis

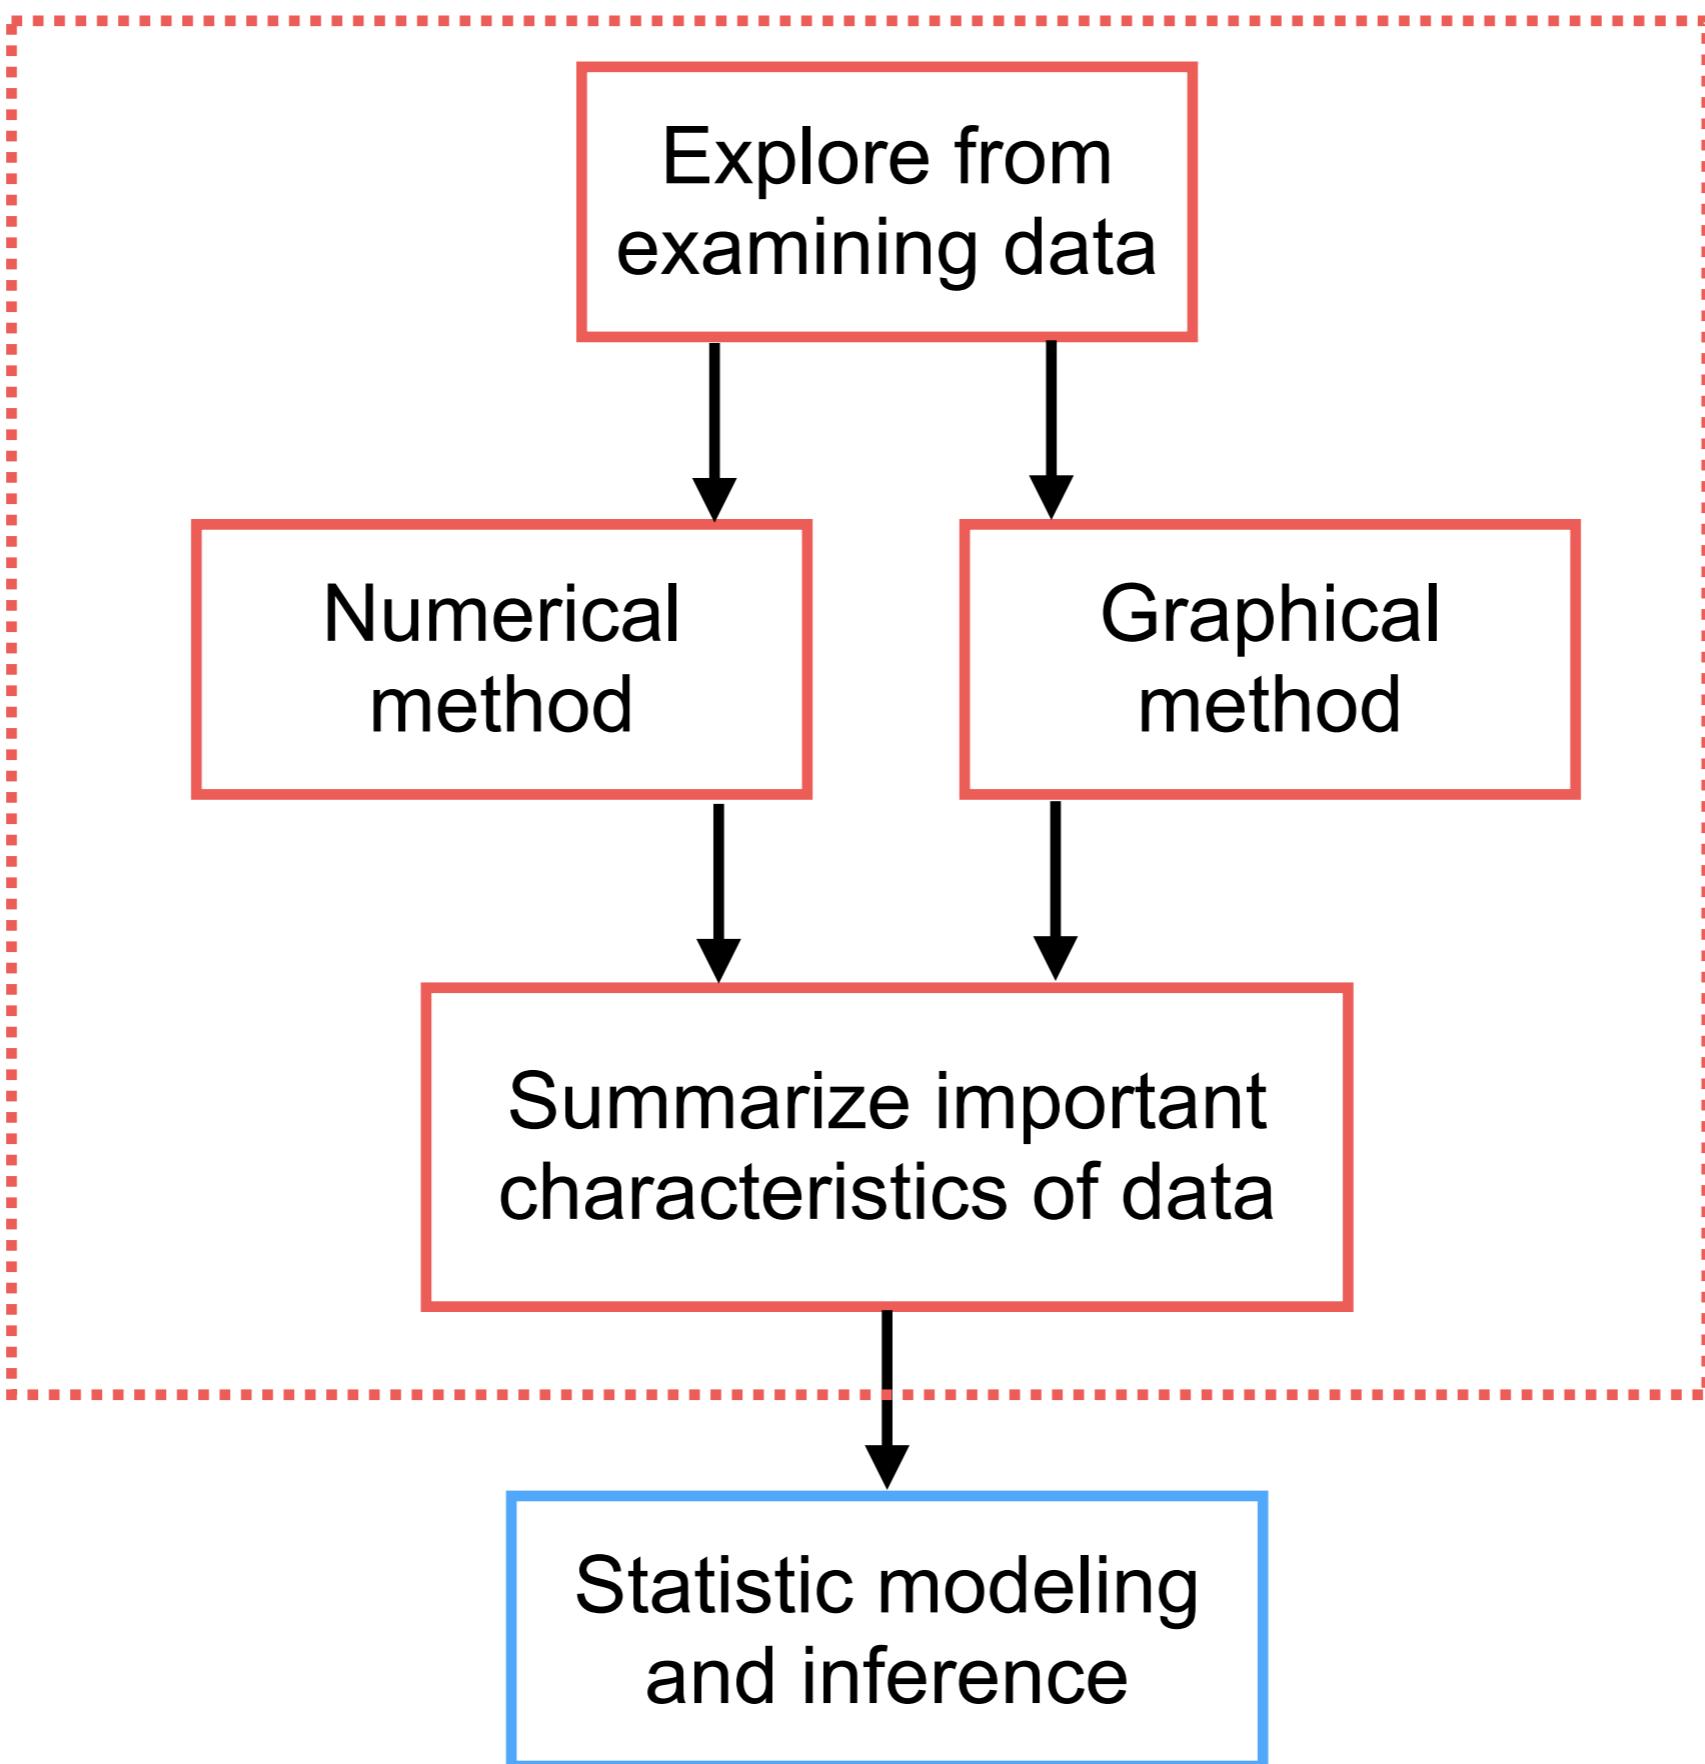

EDA helps in understanding the data, identifying patterns, detecting anomalies, and testing hypotheses.

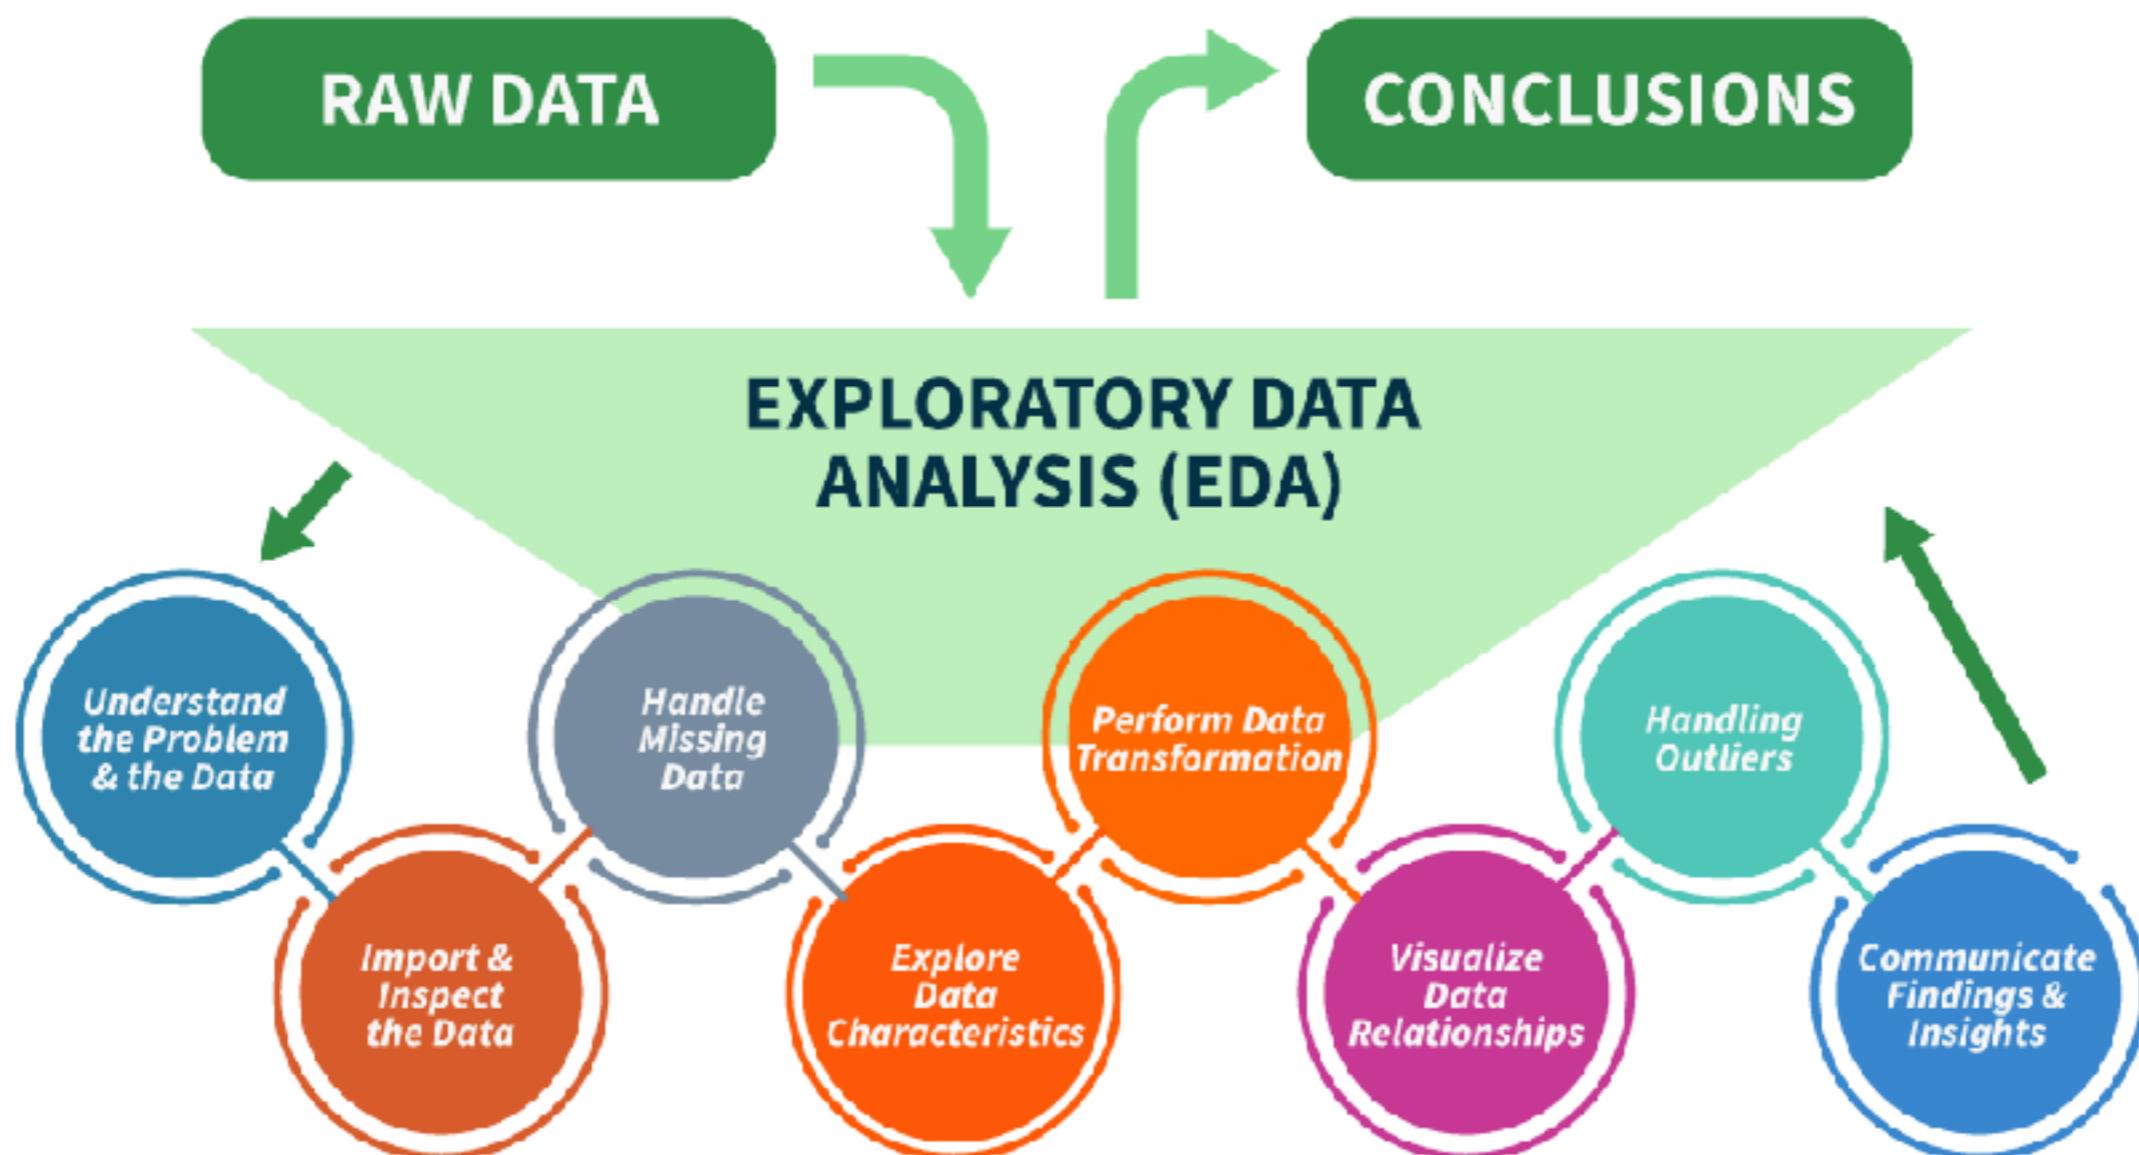

Why EDA ?

- Better understand of data
- Validate assumption about data
- Identify errors and outliers in data
- Interesting trends, patterns and relationships
- Insight and new ideas/hypothesis
- Input for statistic modeling

Steps for Performing Exploratory Data Analysis

Statistical Analysis for data analysis

Key Techniques

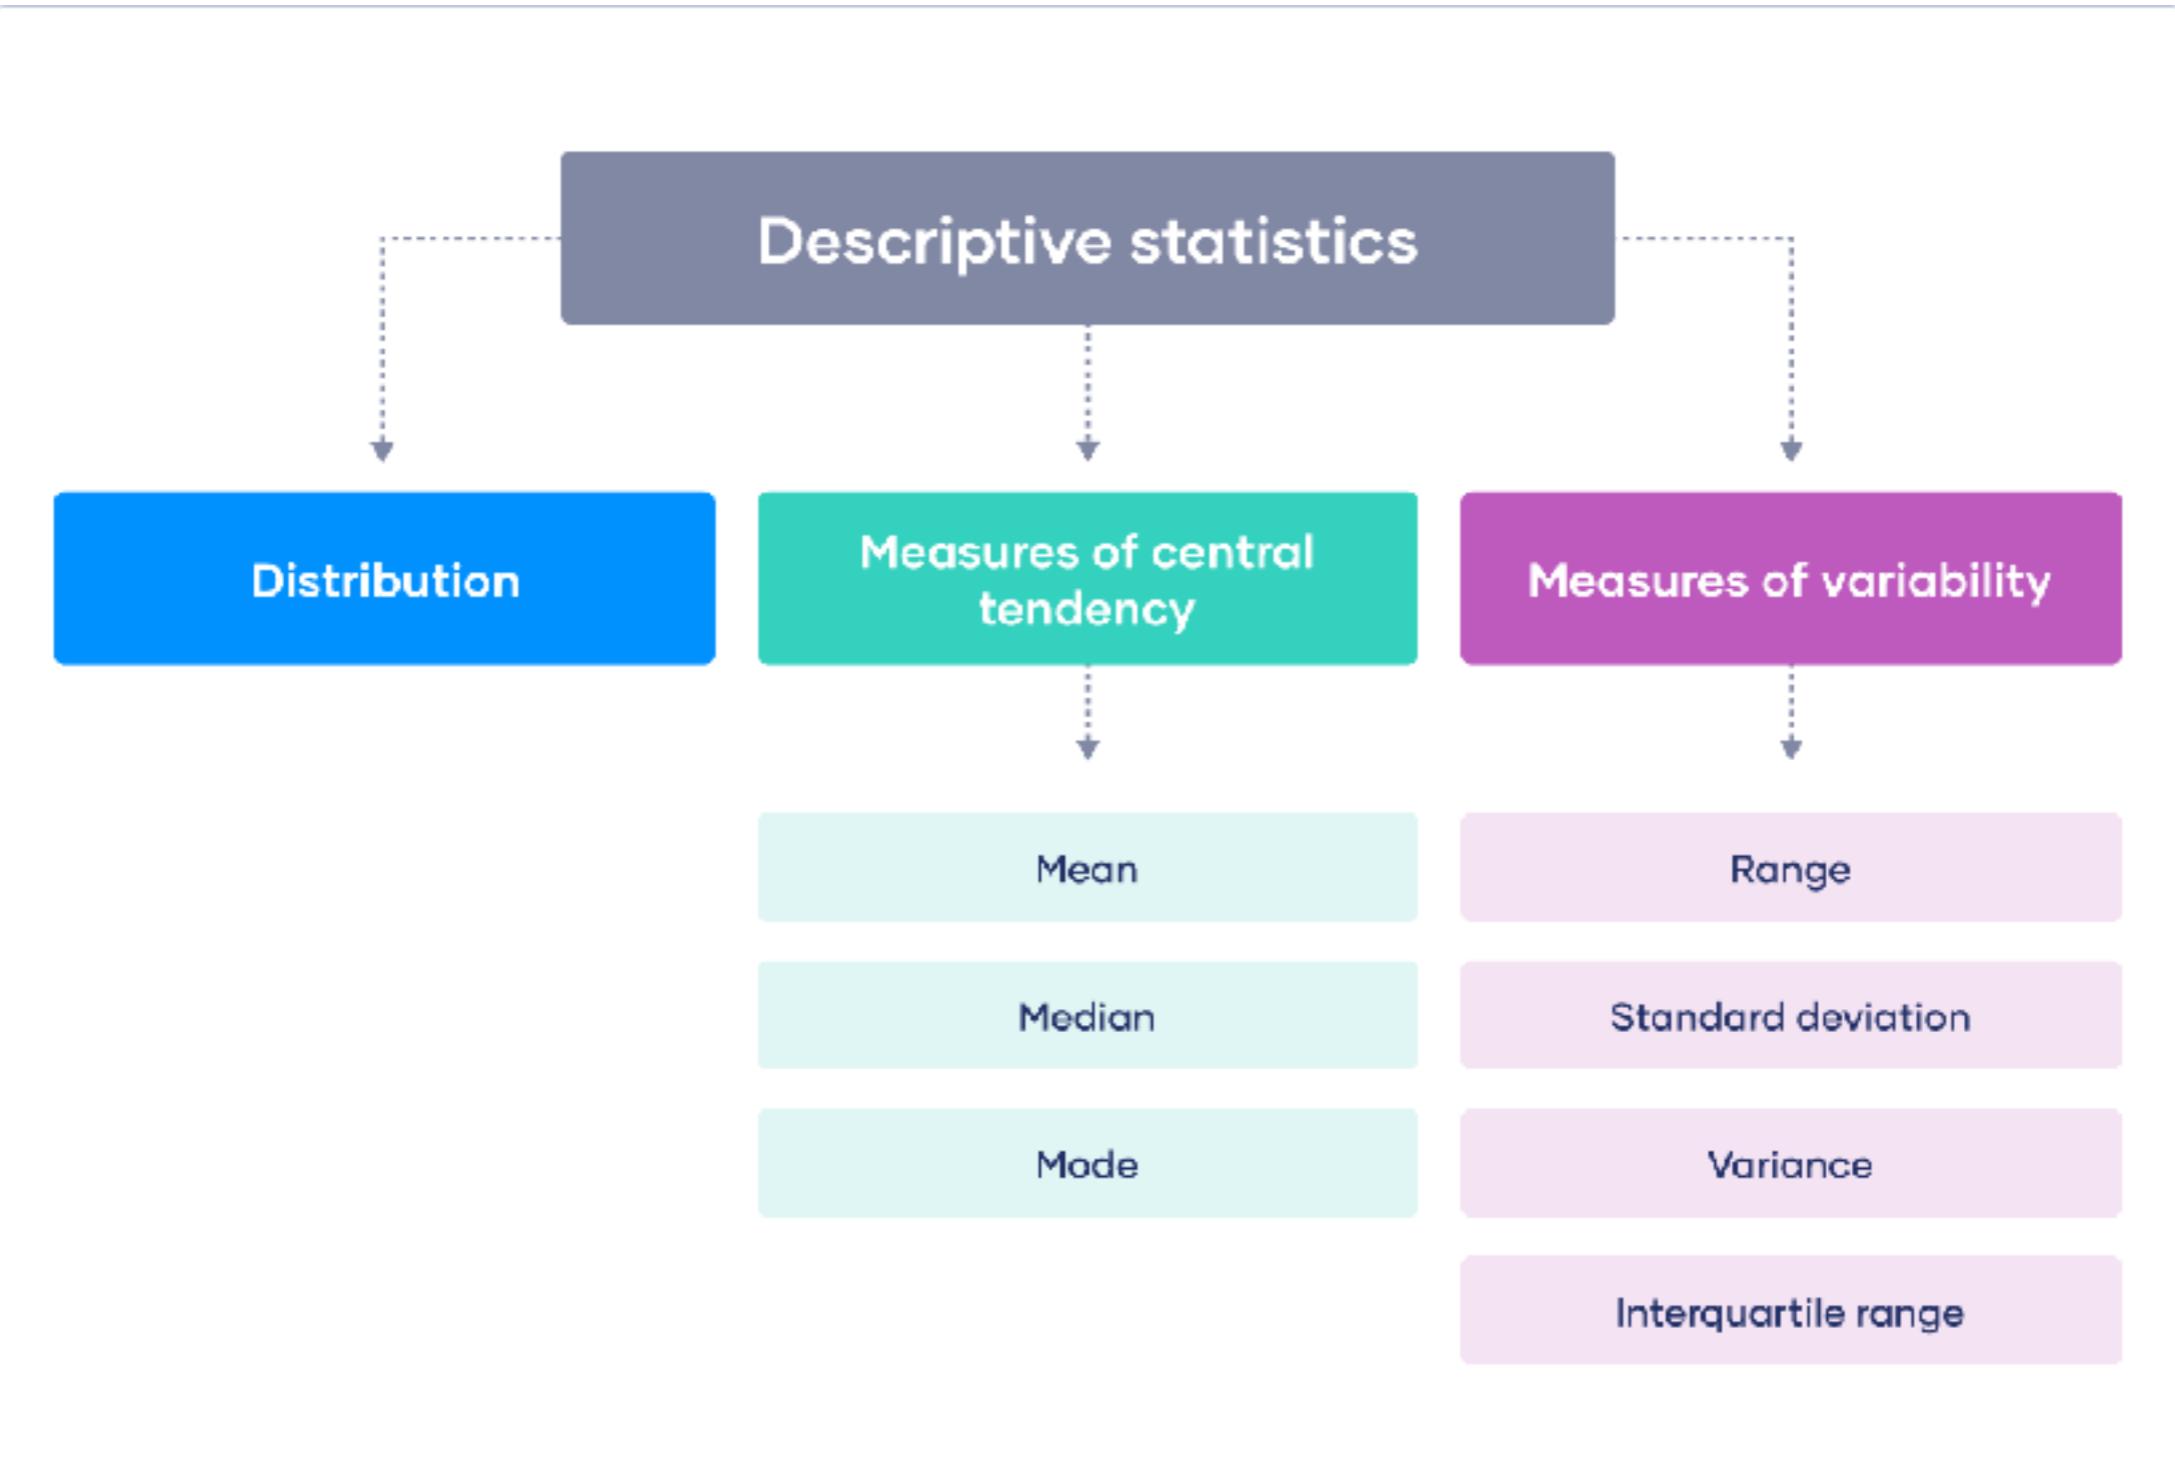

Descriptive statistic

Statistical methods used to **summarize** and describe the **main features** of a dataset.

Help in **understanding the data** by providing a clear overview through numerical measures and visual representations.

Types of descriptive statistic

Measures of Central Tendency

Mean

The average of all data points

Median

The middle value when data points are arranged in order

Mode

The value that appears most frequently in the dataset

Mean

2, 3, 4

1 2 ③

$$2 + 3 + 4 = 9$$

$$\text{MEAN} = 9 \div 3 = 3$$

Power Query

The screenshot shows the Microsoft Power Query Editor interface. The main area displays a table with four columns: 'Name' (含姓氏), 'Last Name (姓氏)', 'First Name (名前)', and 'Last Characters'. The 'Last Characters' column contains numerical values. A tooltip at the bottom left indicates a 'DataFormat.Error' error for the first row. The 'Applied Steps' pane on the right shows the history of transformations, including 'Inserted Last Characters' and 'Changed Type1'.

Name	Last Name (姓氏)	First Name (名前)	Last Characters
กานต์ ใจดี	Error	กานต์	51
กานต์ ใจดี	617.55		62
กานต์	568.55		56

Select Data -> Text to columns

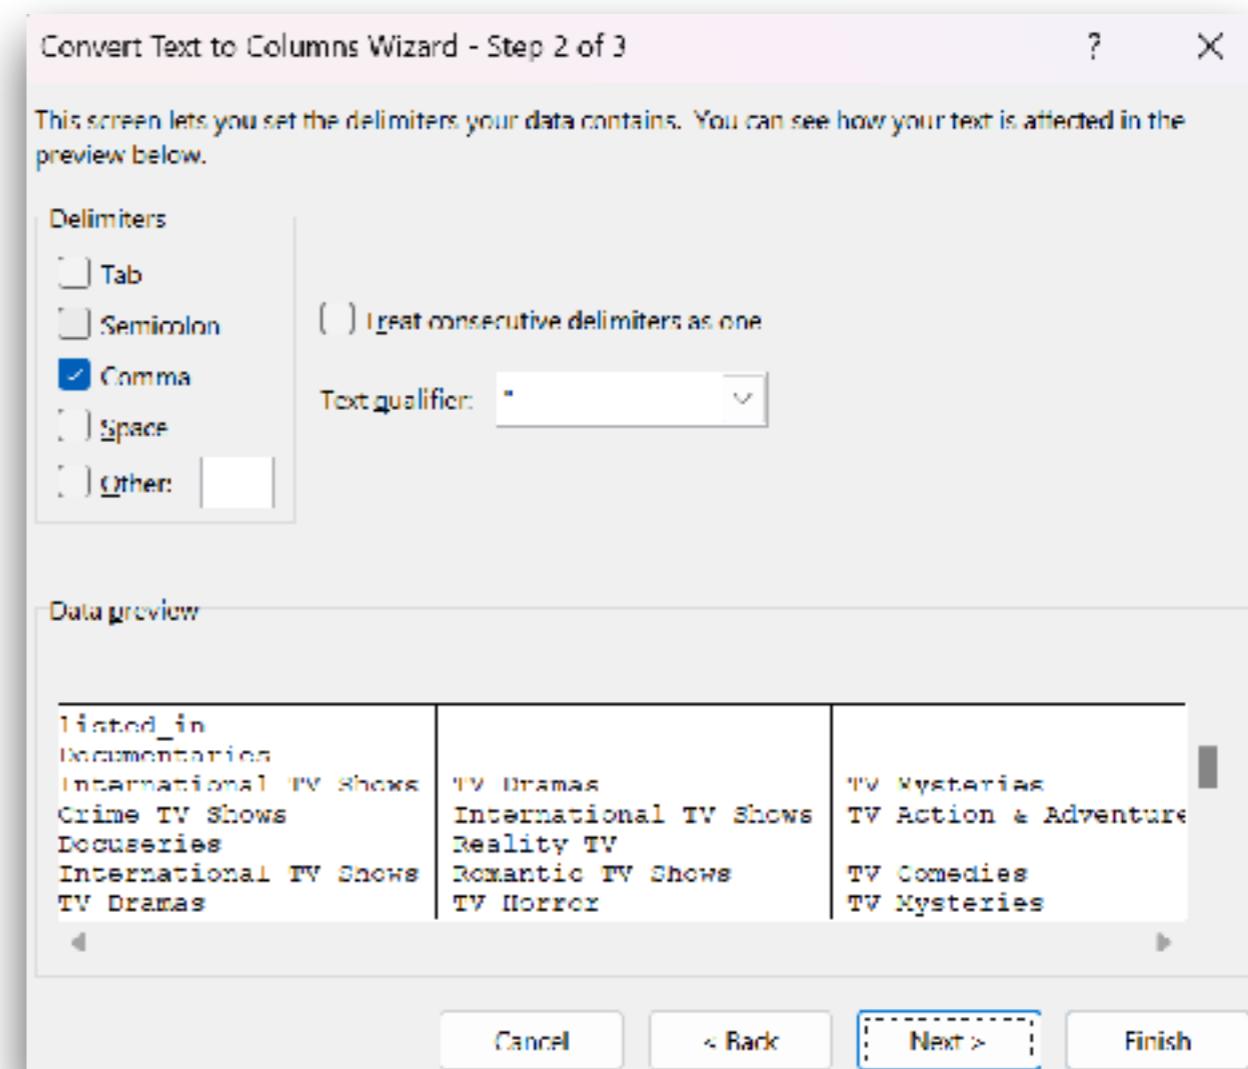

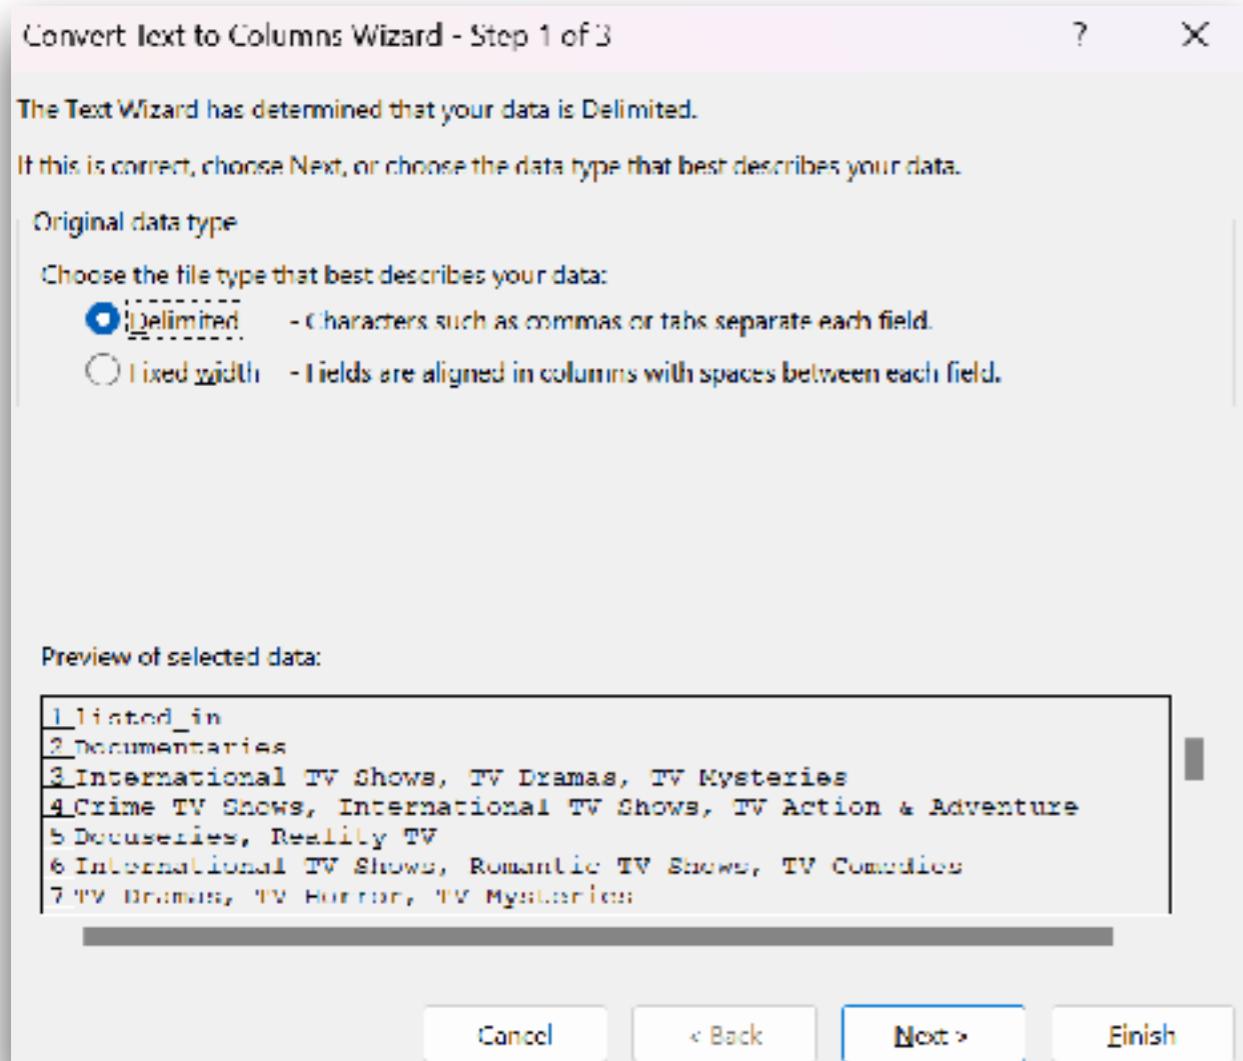

The screenshot shows a Microsoft Excel spreadsheet with a red dashed box highlighting the 'Text to Columns' button in the 'Data Tools' section of the ribbon. A tooltip for 'Text to Columns' is displayed, explaining that it splits a single column of text into multiple columns. It provides examples of separating full names into first and last name columns, and splitting by fixed width or at commas, periods, or other characters. A 'Tell me more' link is also present.

Count the movies & TV Shows before & after the year 2010 ?

Top 10 director has cast more movie ?

Working with Pivot Table

Top 10 director has cast more movie ?

Choose Columns, Rows and Values

The screenshot shows the 'PivotTable Fields' dialog box from Microsoft Excel. The 'Choose fields to add to report' section contains a search bar and a list of fields: type (checked), title (unchecked), director (checked), cast (unchecked), and country (unchecked). Below this, the 'Drag fields between areas below:' section shows the 'Filters' area with 'Rows' expanded, containing 'director'. The 'Columns' area has 'type' selected, and the 'Values' area has 'Count of director' selected. Red annotations on the right side of the dialog box provide instructions: '1. Column = type' points to the 'Columns' area, '2. Rows = director' points to the 'Rows' dropdown in the 'Filters' area, and '3. Values = director' points to the 'Count of director' field in the 'Values' area.
